11. THE PRACTICAL IMPOSSIBILITY OF SEGREGATING THE PLANT INVENTIONS PROVES THAT THE PLANT PURCHASE WAS A NORMAL AND LAWFUL TRANSACTION.

We have seen (*supra*, pp. 541–550) that the Plant inventions have been assimilated into the United Company's machines and that the United Company has made improvements upon those inventions which are built upon and around them, interwoven with them. Those inventions, covered by 43 Plant patents, have been incorporated in 26 of the United Company's machines, including many of its most important machines, such as the Model K Welter, the Model M Outsole Stitcher, the No. 5 Lasting Machine, the

Model B Heeling Machine, the Lightning Heeling Mach[illegible], the Pulling-over Machine, and the Model E Rounding [illegible] Channeling Machine. To take those inventions out of [the] United Company's machines would leave unworkable, wo[rth]less skeletons; there are no machines to take their places, [for] the machines which they superseded have been junked; [and] the United Company would have to develop new mach[ines] and build tens of thousands of them to take the places of [the] stripped machines. This ruthless surgery would set b[ack] the development of the industry a full decade.

It is respectfully submitted that this extraordinary sit[ua]tion is in itself the strongest evidence that the purchase [of] Plant's patents and inventions was a normal and lawful s[tep] in the normal development of the business of a concern which is engaged in inventing, manufacturing, and putting out patented machines.

12. CONCLUSION AS TO THE PURCHASE OF PLANT'S PATENTS AND INVENTIONS.

Even if it were unlawful, the acquisition in September, 1910, of Plant's patents and inventions could not reasonably be regarded as proving the alleged intent conceived early in 1899, more than eleven years before and many years before Plant had made any inventions, to monopolize shoe machinery and destroy existing competition, as is set forth in the petition. Nor could this transaction be connected to that alleged intent on the theory that it was but one of a series of acquisitions extending through the intervening years and made in pursuance of the alleged original scheme, since, as we have shown and as the District Court found, the other acquisitions were not unlawful, they were proper and reasonable steps in the normal and lawful development of the United Company's business and, accordingly, they were not made in pursuance of any unlawful purpose.

But the Plant transaction was not unlawful. It is established by the record and the findings of the District Court that Plant was not in competition with the United Company;

that he did not desire or intend to go into the shoe machinery business; that his sole purpose was to sell his patents to the United Company so that their purchase was a mere purchase of inventions made for the express purpose of being so purchased and combined with the United Company's patents; that the machines which he had constructed and installed in his own shoe factory were crude, really only experimental, constantly breaking down, and making shoes by obsolete and very expensive methods; but that in those commercially unsuccessful machines Plant had incorporated some very valuable inventions which were capable of use in the United Company's superior machines to the great benefit of the shoe manufacturing industry; that both the machines of Plant and those of the United Company infringed a large number of patents owned by the other so that there would have been a great amount of litigation which would have resulted in chaotic and intolerable conditions; that the great benefit to the industry which would result from incorporating Plant's valuable inventions in the superior machines of the United Company and from the avoidance of the great amount of threatened litigation were the sole reasons for the purchase of Plant's patents by the United Company; and that the Plant patents were worth more than the United Company paid for them.

The lawfulness of the Plant purchase can hardly be questioned. The purpose of the purchase was to enable the United Company to perfect its machines and avoid chaotic litigation. The transaction was, therefore, not unlawful because of the intent with which it was done. And obviously it was not inherently unlawful. Indeed, the evident advantages to the shoe machinery industry and to the shoe manufacturers of combining the Plant patents with the United Company's patents, were so obviously beneficial to the public generally and so normal and natural a transaction that, like the formation of the United Company considered in *United States* v. *Winslow*, supra, it was not only not inherently unlawful, but no intent could make it unlawful.

As we have stated, the Sherman Act is directed only against restraints which prejudice the public interests.

In *Nash* v. *United States*, 229 U. S. 373, the Court said (p. 376),—

> ". . . only such contracts and combinations are within the act as, by reason of intent or the inherent nature of the contemplated acts, prejudice the public interests by unduly restricting competition or unduly obstructing the course of trade."

In *Wilder Mfg. Co.* v. *Corn Products Co.*, 236 U. S. 165, the Court said (p. 174),—

> "In other words, founded upon broad conceptions of public policy, the prohibitions of the statute were enacted to prevent not the mere injury to an individual which would arise from the doing of the prohibited acts, but the harm to the general public which would be occasioned by the evils which it was contemplated would be prevented."

In the present case, as we have clearly shown, had the Plant purchase not been made, the public would have been deprived of those machines which combined the latest and best improvements known to the art of shoe machinery, and shoe manufacturers would have been obliged to use far less efficient machines. A transaction which necessarily resulted in so great benefit to the industry, a result which could not otherwise have been accomplished, can clearly not be said to "prejudice the public interests" or produce "harm to the general public." On the contrary, such a transaction is one which public policy must necessarily favor from its self-evident advantage to the public, whatever the motive or intent which induced it. As such a transaction cannot result in "harm to the general public" or "prejudice the public interests," it is inherently lawful and cannot fall within the prohibitions of the Sherman Act.

If—which we deny—it could be contended that the transaction was not so beneficial to the public as to be necessarily lawful, but that it was a transaction which unlawful purpose might bring within the prohibition of the statute, the record clearly shows that no uniawful purpose existed. Being entered into for the purpose of enabling the United Company to produce more efficient machines and to avoid chaotic patent litigation, which would not only have been very annoying and expensive, but would have resulted in preventing its putting out even as efficient machines as it was then manufacturing, the transaction was clearly a "normal" contract entered into

for the purpose of "reasonably forwarding personal interest and developing trade." (*Standard Oil Co.* v. *United States*, supra.)

Can it possibly be contended that the purchase was not made for the direct purpose of acquiring and using the Plant patents and ending the existing and threatened patent litigation? We do not understand that the United States denies that these purposes existed. While the United States has attempted to minimize the value of the patents, it must admit that they were bought to be used by the United Company, that they have been so used, and that they have proved to be of very great value to the United Company and the shoe manufacturers. The contention of the United States apparently is that the United Company feared that Plant might become a competitor, and that this was an additional inducement to make the purchase. The record clearly refutes this contention, showing that the officials of the United Company believed that the Plant machines would not be commercially successful, that they purchased Plant's patents at his solicitation, that they would not purchase until after a thorough examination had convinced them that the patents would be of great value in increasing the efficiency of the United Company's machines, and that they realized the chaotic patent situation which existed and the intolerable conditions which would result. If it can be doubted that these were the sole purposes which actuated the transaction, it certainly cannot be questioned that Plant's patents were of great value and that the United Company desired to use them, and the most that can be contended is that possible competition by Plant was an added motive for the purchase. But if possible competition by Plant influenced the United Company, which we deny, this can only have been because the United Company believed Plant's patents to be so valuable that he would be able to offer machines attractive to customers which the United Company by reason of Plant's patent monopolies could not make. Plant had no established shoe machinery business or good-will, and the machines which he had constructed were so defective and unsatisfactory that if he had desired to go into the shoe machinery business he would have been obliged to develop and build a new line of machines. He had no better or greater

opportunity to compete with the United Company than any other one of thousands of American business men except in one respect, namely, his patents. If he could enter the shoe machinery business successfully, it would be solely because his patents enabled him to offer machines which the United Company was legally restrained from making. In other words, if the United Company feared competition, it was a competition which consisted in offering machines which the United Company could not manufacture, and, therefore, a competition which it could not meet on equal terms and which neither public policy nor the Sherman Act would prohibit it from meeting by the acquisition of the patents. In attempting to meet such competition, the United Company would be under a legal restraint, the restraint imposed by the lawful patent monopolies held by Plant. The Sherman Act was intended to prevent unnatural, abnormal restraint imposed on "the free flow of commerce." The removal of a restraint imposed by patent monopolies through the purchase of such monopolies cannot constitute the imposition of a restraint on the free flow of commerce such as the Sherman Act was designed to prohibit.

For a further discussion of decisions of this Court as to the right to acquire patents see *supra*, pages 486–487.

VII.

THE CHARGE THAT THE UNITED COMPANY COMMITTED VARIOUS UNFAIR, OPPRESSIVE OR MONOPOLISTIC ACTS IS UNFOUNDED.

1. THE CHARGES SPECIFIED IN THE BILL OF PARTICULARS.

In Section VI of the petition (R. Vol. 1, p. 999) defendants are charged with having made various threats or committed various unfair and oppressive acts. No specific instances are set out in the petition, but a bill of particulars, setting forth the specific instances charged, was filed during the course of the trial (R. Vol. 1, p. 1075). The bill of particulars sets forth over fifty different alleged acts or threats. **As to at least thirty no evidence whatever was offered by the United States. This fact illustrates the unfounded character of the charges.**

Some instances consisted merely of requests by the United Company to lessees that they conform to the terms of their leases. In a few cases the United Company undertook to enforce such terms. In several instances these leases had been put out by the constituent companies prior to the formation of the United Company. In every such instance if there is criticism it must be with the terms of the lease and not with the request to observe or the enforcement of these terms.

Some instances consisted of alleged threatening statements of officers of the company made to other shoe machinery manufacturers as to what it would do. In no case was the alleged threatened action taken. These alleged threats are all disputed by the company and involve the credibility of witnesses and the truth or probability of their statements.

Practically all of the evidence introduced by the United States with respect to these alleged threats or acts came from patent owners or competitors who had sought unsuccessfully

to sell out their property to the United Company, or from lessees with whom the company had had a disagreement.

The number of instances referred to by the United States is surprisingly small, considering that the entire business life of the company has been examined and extraordinary efforts made to put in evidence all acts or remarks of the officials or agents of the company occurring over this extended period of time, as to which any contention of unfairness or dissatisfaction could be made. The company has over 1,000 lessees with whom it is constantly in touch through its service men and with whom it is constantly dealing, making leases for new machines, taking back old machines, checking up royalties and furnishing service and new parts. Owing to the great variety of machines, of findings, and of supplies used in the shoe machinery business the United Company is constantly being asked to acquire new patents and businesses. For example, 493 different ideas, suggestions, and inventions have been submitted to the company by persons not employed by it as inventors, and have been declined (Defs.' Ex. 222, R. Vol. 5, p. 370). Over 75 different concerns have been offered for sale to the United Company and their purchase declined (Defs.' Ex. 233, R. Vol. 5, p. 527).

The District Court, after considering the facts in respect to such of these transactions as were relied on by the United States in argument, concluded as follows (R. Vol. 1, pp. 1152–3):—

> "The history of the proceedings in this case indicates that efforts which may fairly be described as extraordinary have been made to bring before the court, so far as possible, all sayings or doings of any of the numerous defendants or their representatives, during the period beginning with 1899 and ending with 1911, which might afford ground for charging them with oppressive, coercive, or like unfair conduct toward competitors of the United Company or the public. In view of the long period and wide fields thus searched, the numerous abandoned attempts to prove something of the kind above indicated, and the insignificant result of the evidence actually offered and finally relied on, the conclusion seems fully justified that the policy and methods pursued by the defendants and by the United Company have been, in general, above reproach in any of these respects."

In view of the District Court's finding and the complete failure of the United States to substantiate these charges, it hardly seems necessary to consider the evidence relating to them in detail; however, a detailed statement of the evidence is given in the Appendix (see Appendix II, *infra*, pp. 743–807), and we will summarize here the evidence relating to those charges which were supported by any evidence:—

1. The United States charged that the United Company removed its machines from Peter Tessier & Company's factory where a competing machine was used.

The evidence shows that Tessier leased seven machines from the United Company. He obtained other machines to do his work and discontinued entirely the use of the United Company's machines except that he used the auxiliaries without paying anything for such use. The United Company therefore removed its machines which were not being used at all or were being used without payment (see Appendix II, p. 743).

2. The United States charged that the United Company removed its machines from Bottomley's factory where a competitor's machine was used.

The evidence shows that Bottomley had stopped using the United Company's machines in his factory and notified it that he would pay no further royalties on them. The United Company therefore merely removed machines which the lessee no longer desired to use or pay for (see Appendix II, p. 746).

3. The United States charged that the United Company threatened to take back its machines from T. D. Barry Company in order to force the removal of competing machines.

The evidence shows that the T. D. Barry Company gave up the use of its Goodyear welters and stitchers, but continued to use Goodyear auxiliary machines without paying any royalty for them. The United Company, therefore, brought a replevin suit to take back its machines. The dispute was adjusted, and Barry retained the United Company's machines (see Appendix II, p. 748).

4. The United States charged that the United Company threatened Curtis & Jones and caused them to remove from their factory other machinery.

The evidence shows that Curtis & Jones in 1897 had agreed with the old Goodyear Company to use its turn machines ex-

clusively in consideration of a 50% reduction in royalties. They broke this agreement and their attention was called to it and they gave up the use of the other machines. The superintendent of the factory testified he made up his mind that the Goodyear machines were better and cheaper to operate and that the United Company's service was preferable (see Appendix II, p. 750).

5. The United States charged that Hilliard & Tabor installed a Haverhill Turn Sewing Machine and the United Company threatened to make the terms of its lease covering its turn machines more onerous if the lessee used the Haverhill machine.

The evidence shows that Hilliard & Tabor had a Goodyear Turn Machine and then installed a Haverhill machine, continuing to use the Goodyear auxiliaries without payment of royalty. After some months Mr. Hilliard happened to be at the United Company's office and his attention was called to the situation, and he was offered the initial payment form of lease if he wished to continue using the Haverhill machine (see Appendix II, p. 754).

6. The United States charged that the Harsh-Edmonds Shoe Company desired to take a clicking machine from a competitor and was warned and threatened not to, and therefore took the United Company's machine.

It appears that the Harsh-Edmonds Shoe Company obtained a clicking machine from the Richardson Company. Mr. Harsh objected to the United Company's lease covering clicking machines. He testified that Mr. Wilson, of the United Company, told him, or, as appeared on cross-examination, he thought intimated to him, that it would be better for him to cease his activity against the United Company and take things as they were. Mr. Wilson pointed out to him that he already had another lease of the same character. Mr. Wilson was dead at the time of the trial. Mr. Harsh took the United Company's machine, which he admitted was the only commercial machine in the market. He also admitted that Wilson's advice was sound (see Appendix II, p. 756).

7. The United States charged that a threat of onerous terms was made to George A. Learned if he continued to use competitors' machines.

Mr. Learned testified he had Goodyear machines. He later

obtained a Haverhill machine and claimed that Mr. Winslow told him he must pay on all the shoes he made or be driven out of business, and the least the United Company would do would be to take out its machines. This evidence was absolutely contradicted by Mr. Winslow and by Mr. Brown, who was present at the interview. Mr. Endicott testified that Learned later admitted he had been mistaken. No action was taken by the United Company, and Learned is still using the Haverhill machine (see Appendix II, p. 759).

8. The United States charged that William Barbour, one of the directors of the United Company, made threatening statements to James N. Darrah, of the Standard Shoe Machinery Company, a competitor of the United Company.

Mr. Darrah testified Mr. Barbour told him he was making a big mistake not to sell; that if the United Company could not buy out its competitors it crushed them; that he could not get any money to compete, as the United Company's influence was too great with the banks both in Boston and New York. Mr. Barbour absolutely denied making any such statements. Mr. Darrah was shown to be without financial responsibility or settled business (see Appendix II, p. 761).

9. The United States charged that E. P. Hurd, of the United Company, threatened H. E. Cilley.

Mr. Cilley testified that he interviewed Mr. Hurd as to the sale of a leveling machine which Cilley had invented, and that Mr. Hurd said, "Cilley, you are thick. If you were offered fifteen or twenty thousand dollars I think under the circumstances you ought to be very well satisfied," and further told him that he could not do business except on the United Company's sufferance. It did not appear that Cilley was interfered with in any way. Cilley had been in litigation with United Company since 1903 (see Appendix II, p. 764).

10. The United States charged that Mr. Winslow threatened Charles H. Morse, who was endeavoring to market the Frechette pegging machine and a slugging machine.

Mr. Morse testified he called on Mr. Winslow about a purchase of his business. Mr. Winslow said, "You don't suppose we are going to allow you to put them on the market" (meaning Mr. Morse's machines). Mr. Winslow denied making such a statement. It further appeared probable that Mr. Morse

had not seen Mr. Winslow since the United Company was formed, and that the conversation referred to, if it took place at all, occurred before the United Company was formed. It did not appear that Mr. Morse was interfered with in any way (see Appendix II, p. 765).

11. The United States charged that E. P. Hurd, of the United Company, threatened G. H. Clark and refused to let him have one of the United Company's machines to experiment with.

Mr. Clark testified he had invented a method for molding or lasting shoes and put one of his machines in a shoe factory; that he called on Mr. Hurd to get a lockstitch machine to put in the same factory and Mr. Hurd told him the United Company must protect its interests and not put one of its machines into a factory for Clark to experiment with (see Appendix II, p. 766).

12. The United States charged that Kimball & Hadley, who manufactured needles and awls, were threatened by the United Company, and that in consequence they sold their business to the United Company.

Hadley testified that Bayley, an agent of the United Company, told him that he could not manufacture needles as cheap as the United Company, which could give them away if necessary. Mr. Bayley was in a sanitarium and could not testify. Mr. Hadley also testified that certain manufacturers had stated that the use of his needles and awls was in violation of the leases of the United Company. This testimony was absolutely denied by the manufacturers, and no lease of the United Company does contain such a provision. Hadley had been unsuccessful in litigation with the United Company and had been enjoined by the court (see Appendix II, p. 767).

13. The United States charged that three operatives of the Plant factory were employed by Willson, general manager of the United Company, to organize a union of the employees at the factory and start a strike.

These three men testified they called on Mr. Willson, who agreed to pay them $2,000 apiece and their expenses if they would organize the employees of the Plant factory and start a strike. They testified they spent $1,500 in entertaining the employees and giving them a good time. They testified their

wages averaged about $15 a week, and this sum represented the savings of eleven or twelve years. They had no papers, receipts, or written evidence of any kind to support their story, claiming they had destroyed all their papers and the list of operatives' names. Their story was flatly contradicted by nine operatives in the Plant factory, who testified that they worked in the same room with the men who claimed they were so employed, and knew them well, and they had no knowledge of any union being organized or of any strike being attempted, and that no money was spent among the employees as testified to.

The testimony of these witnesses is incredible (see Appendix II, pp. 776–779). The District Court said of it (R. Vol. 1, p. 1152),—

> "Not only does the evidence of these three witnesses appear unworthy of belief in view of its improbability, its lack of corroboration, and the evidence tending to discredit it, but it is difficult to understand how the petitioner could seriously have expected the court to accept such testimony, or have considered itself justified in offering it."

14. The United States charged that in 1910 the agents of the United Company induced a former employee of the Plant Company to demonstrate one of the Plant machines.

This was not denied, but was a harmless performance (see Appendix II, p. 780).

15. The United States charged that Mr. Winslow threatened C. S. Johnson and duplicated his machine.

Mr. Johnson testified that he was connected with a company which put out a leveling machine, that he agreed with Mr. Winslow upon a sale to the United Company of the machine, but the contract for purchase when prepared was not satisfactory to him and he declined to sign it. Mr. Winslow suggested he had better sign it because he was going to have the business anyway, or words to that effect, and that shortly afterwards the United Company put a similar machine on the market. Johnson admitted he had a grievance against the United Company and was hostile to it (Appendix II, p. 782). Winslow denied any such conversation, and testified that the United Company had never interfered with Johnson's business.

16. The United States charged that Mr. Winslow threatened Frank L. Harmon, an inventor, and treated him unfairly in various ways.

Mr. Harmon testified he was developing some machine, and, having no business experience, he came to Mr. Winslow for information, who advised him that he was foolish to go into the machinery business with the small amount of capital he had. This conversation took place about twenty-five years before, and long previous to the formation of the United Company (see Appendix II, p. 783).

17. The United States charged that the N. D. Dodge Shoe Company was using machines of the Haverhill Shoe Machinery Company but when they desired to put in the United Company's welt machines they had to discontinue using the Haverhill machines because the installation charges demanded were so large.

The only evidence in support of this charge was hearsay evidence of L. H. Harriman, treasurer of the Haverhill Company, who testified that the Haverhill machines were discontinued by the Dodge concern because the Haverhill Company could not supply the welt machinery which they wanted and the United Company would not do so as long as they used Haverhill machines.

William G. Dodge testified that they tried the Haverhill machines while they were waiting for new machines of the United Company and that when the new machines were ready they discontinued the Haverhill machines because the United Company machines were more efficient (see Appendix II, p. 787).

18. The United States charged that Carlton & Hunt were using machines of the Haverhill Shoe Machinery Company and desired to obtain welt machines of the defendants, and were informed they would have to discontinue the use of the Haverhill machine or pay a prohibitive installation charge on their new machines.

The only evidence in support of this charge was the hearsay statement made by Harriman, an agent of the Haverhill Company, to the effect that Mr. Hunt had told him he could not get United Company's welt machines unless he discontinued using the Haverhill Turn Machine. Carleton & Hunt

were using in connection with the Haverhill machine a number of United Company machines for the use of which the United Company was not receiving any compensation (see Appendix II, p. 790).

19. The United States charged that one Webster was operating two Pettengill nailing machines, and because of this fact could not get pulling-over and toe-capping machines from the United Company without paying excessive installation charges, and he therefore removed the Pettengill machines.

Webster testified that the United Company offered him these machines without restrictions if he paid an initial payment or, as an alternative, offered him a restricted lease without the initial payment. The initial payment, he said, would cost him more than it would if he used the United Company's entire machinery (see Appendix II, pp. 790–791).

Charges as to Rebates.

The United States charged that the United Company granted rebates to manufacturers to effect an exclusive use of its machinery, (1) by making distribution of its stock to users of its Goodyear machines and, (2) by cancelling the royalty on the Gem Insole Machines to users of its other machinery.

1. On June 10, 1910, the United Company sent a circular letter to its lessees in which it stated that beginning January 1, 1910, it would create a fund by investing each year for three years in the common stock of the United Company a percentage increasing each year of the amounts received from lessees for the use of Goodyear Welting, Stitching, and Turn Sewing Machines in the United States. At the end of three years it agreed to distribute the entire amount of stock held in the fund among those lessees who used the Goodyear Welting, Stitching, and Turn Sewing Machines, and who should have faithfully observed the covenants of their leases, each lessee to receive a share of the fund proportionate to the amounts paid by him for the use of such machines. It agreed that not less than 15% of the amount received from welting and stitching machines and 10% of the amount received from turn machines would be so invested (P.'s Ex. 146, R. Vol. 4, p. 1067).

This offer did not require an exclusive use of the United Company's machines, but merely proposed to return a portion of the royalties received from lessees who used Goodyear welting, stitching, or turn machinery if they observed the covenants of their leases which, of course, they were morally and legally required to do. It amounted merely to a reduction in the price charged for this machinery, such reduction to be represented by stock of the United Company. This was not unlawful.

Wilder v. *Corn Products Co.*, supra.

The Attorney-General was notified during the pendency of this suit that the United Company proposed to carry out this plan, and he offered no objection to it (R. Vol. 1, p. 979, and Defs.' Ex. 344, R. Vol. 5, p. 953).

2. On January 29, 1900, the executive committee of the United Company voted that a rebate be granted to exclusive users of the company's machines, such rebate to be made by quarterly payments of amounts equal to the sums paid by them respectively as royalty on the Gem Insole Machines during the quarter for which the rebate was made (R. Vol. 1, p. 351, line 39–p. 352, line 6).

The United Company after it was formed acquired the Gem Insole Machines, which had been put out previously for a royalty charge of one-half cent per pair (R. Vol. 1, p. 430, lines 11–13). This machine was used in the manufacture of Goodyear Welt shoes. It was practically made, upon its acquisition, an auxiliary of the Welt Set. A number of these machines were already out on leases, and the machine was therefore put out by the United Company on a separate lease, but the royalty was repaid or credited to manufacturers who used the Goodyear Set of machines. It was necessary to have a general vote to apply to machines already out on lease as well as those which might be put out, and that was the purpose of the general vote (R. Vol. 1, p. 852, lines 33–41; p. 664, lines 31–36).

2. OTHER CHARGES OF UNFAIR, OPPRESSIVE OR MONOPOLISTIC ACTS, NOT SPECIFIED IN THE BILL OF PARTICULARS.

The United States also claims that the United Company has committed certain other unfair or oppressive acts, although they were not specified in the bill of particulars.

The evidence which the United States relies on to support these charges consists for the most part in the evidence of competitors who were endeavoring to displace the United Company's machines by their own and who in their testimony repeated statements alleged to have been made to them by shoe manufacturers.

In each instance the shoe manufacturer had the United Company's machines which he had agreed to use so far as he had work for them and substitution of the competitor's machines would have resulted in his setting the United Company's machines aside and letting them stand idle. This would, of course, have been a violation of the Full Capacity Clause in his leases.

Furthermore, it should be remembered that if a shoe manufacturer does not want a competitor's machines it is easier for him to say he cannot take them than to argue their relative merit with the salesman. Remarks made by shoe manufacturers to salesmen as to the reasons why they do not take such salesmen's machines cannot be treated with great seriousness.

So far as the evidence bearing on these charges shows anything material it shows that the United Company was always willing so to arrange a shoe manufacturer's leases that he could use with the United Company's machines any other kinds of machines obtained from competitors which he wished to use.

The evidence regarding these charges is reviewed and discussed in Appendix II (*infra*, pp. 791–804), and at the end of that discussion will be found quotations from the opinion of the District Court showing its findings as to the charges of unfair and oppressive acts and as to the charges that provisions of the leases have been arbitrarily enforced (Appendix II, *infra*, pp. 804–807).

VIII.

THE UNITED COMPANY HAS NOT MADE EXORBITANT PROFITS AS CHARGED IN THE PETITION.

The petition charges that the United Company has made enormous and unreasonable profits (R. Vol. 1, p. 1026). This charge is without foundation.

The only purpose of this allegation is to support the charge that one object of the defendants' conspiracy or project was to "enhance the cost of said machines to users thereof" (R. Vol. 1, p. 997). As the record shows that the United Company has very materially reduced the cost to shoe manufacturers of their machines by removing initial payments, reducing royalties in certain cases, and giving shoe manufacturers enormously improved machines, this charge of intent to enhance the cost of shoe machinery to shoe manufacturers is proved to be absolutely unfounded. If the economies and improvements introduced by the United Company have enabled it not only to reduce the cost to shoe manufacturers of their machines, but also to make large profits itself, this shows no illegal or unlawful purpose.

But the charge that the United Company has made unreasonable profits is without foundation.

The United States in support of this charge called Richard N. Morton, auditor of the United Company and of the United Shoe Machinery Corporation. His testimony showed that the earnings based on the net assets of the United Company and the United Corporation for the period from March 1, 1905, to March 1, 1911 (the period chosen by the United States), were 14.01% and the average rate per cent. of cash dividends to net assets was 7.10% (R. Vol. 1, pp. 359–360) (Defs.' Ex. 95, R. Vol. 5, p. 124).

Mr. Morton showed that the allegations in the petition that

the United Company had made $45,314,261 in the period from March 1, 1905, to March 1, 1911, was due to erroneously combining the earnings of United Shoe Machinery Corporation and its subsidiary, the United Company, thus including a large part of its earnings twice (R. Vol. 1, p. 360). The charge in the petition that these earnings were made on $20,000,000 of invested capital was not true (R. Vol. 1, p. 360). The net assets at all times during this period exceeded this amount and in 1910 amounted to $40,771,821.

In Mr. Morton's figures practically no value is placed on the patents owned by the United Company. The company has carried its patents during this period at only $400,000. The patents on the 150 new machines developed by the United Company, including the valuable patents on the pulling-over machine, which cost the United Company nearly $1,000,000 to develop, the clicking machine patents and numerous other valuable patents, including patents on thirty-nine machines which perform work previously done by hand, which have been invented and acquired by the United Company since its organization, have not been capitalized. If these patents were included in the assets at a fair valuation the percentage of profits would be greatly reduced.

The District Court found as follows with respect to this charge (R. Vol. 1, p. 1135):—

> "No support is found in the evidence, for the charge in the petition (Par. X) that 'enormous and unreasonable profits' had been made. . . . Nothing shown by the evidence warrants the conclusion that profits unreasonably out of proportion to the extremely large cost at which the business has been developed and is maintained, the great investment of capital it has required, and the enterprise, inventive skill, and business ability devoted to it, have been realized. Nor has it been made to appear that the charges made for the privilege of using the machines are exorbitant or unreasonable; especially in view of the great benefit to manufacturers using them, in lessening their cost of production."

IX.

FORMATION OF THE UNITED SHOE MACHINERY CORPORATION.

The petition charges (par. Ninth, R. Vol. 1, p. 1024) that the United Shoe Machinery Corporation was organized in 1905 and acquired practically all the stock of the United Company in order to provide means for distributing a portion of the accumulated surplus of the United Company and to secure better means for destroying competition and monopolizing commerce.

The United Shoe Machinery Corporation issued its preferred stock, share for share, for preferred stock of the United Company and issued 1½ shares of its common stock for each 1 share of the common stock of United Company (R. Vol. 1, p. 358, line 27).

The petition admits that the business of the United Shoe Machinery Corporation has been confined to holding the stock of the United Company (R. Vol. 1, p. 1025). No other evidence was introduced relating to the United Shoe Machinery Corporation. The charge that it was formed to restrain trade or monopolize more effectively is therefore shown to be without foundation.

X.

THE UNITED COMPANY HAS NO UNLAWFUL MONOPOLY OF SHOE MACHINERY. THIS FACT NECESSARILY DISPOSES OF THE PRESENT SUIT.

1. Introductory Statement.

The petition charges that the defendants in or prior to 1899 "determined to acquire a complete monopoly of the manufacture, sale and lease of shoe machinery" and that the various acts described in the petition were steps in carrying out this unlawful project (R. Vol. 1, p. 994). After setting forth the various acts charged it alleges that the defendants have thereby acquired a monopoly in shoe machinery (R. Vol. 1, p. 1027).

It is essential to the case of the United States that it prove the existence of this monopoly.

In the first place, there is no evidence of the unlawful plan or project charged in the petition or of any unlawful purpose unless it can be inferred from the acts of the defendants as proved in the record. If these acts during a period of more than twelve years have not resulted in an illegal monopoly, it is obvious that they are not of a character to cause such result, and, therefore, cannot well give rise to any inference of an unlawful plan to obtain an illegal monopoly. An unlawful plan to accomplish an illegal result cannot be shown by proof of acts which are either not adapted to or cannot accomplish the result.

In the second place, the purpose of this suit is primarily (1) to have the United Company dissolved because it is an unlawful monopoly, and (2) to have the leases declared un-

lawful because they have created or aided in creating this unlawful monopoly. If the United Company is not an unlawful monopoly it should not be dissolved. If no unlawful monopoly exists, it is evident that the leases have had no unlawful effect, *i.e.*, they have not created or aided in the creation of an unlawful monopoly, and they, therefore, cannot be held unlawful on the ground that they have done so.

2. The United Company has not obtained a Monopoly of all Shoe Machinery as Charged in the Petition.

The District Court said with reference to this charge (R. Vol. 1, p. 1127):—

> "The restraint or monopoly alleged in the petition is restraint or monopoly of interstate commerce in 'any and all kinds of shoe machinery,' *i.e.*, in shoe machinery generally.
>
> "But it appeared early in the trial that no such charge could be proved, because neither the business of the component companies in 1899 nor that of the United Shoe Company from its beginning until the bill was filed related to 'all kinds of shoe machinery.' Both were always limited to certain kinds only. This was finally conceded. . . ."

There is a large field of shoe machinery not manufactured by the United Company at all, such as all the different machines for sewing the uppers of shoes (machines exceedingly important in the manufacture of a shoe), and many others.

In addition there are manufacturers who, in competition with the United Company, furnish every kind of a machine needed in the manufacture of shoes. Of course such competitors do not manufacture machines exactly like the machines of the United Company, because these machines are made under patents and the United Company has a lawful monopoly of their manufacture.

The failure to prove the charge of monopoly in all shoe machinery is illustrated by the following facts:—

R. P. Hazzard, a shoe manufacturer, making Goodyear Welt shoes, with an output of 5,000 pairs a day (R. Vol. 1, p. 641,

line 10), testified that he used in the Bottoming Department all the machines that the United Company produces and he could get (R. Vol. 1, p. 641, lines 26–28; p. 651, lines 10–13). A complete list of the machines in his factory appears in Defendants' Exhibit 262 (R. Vol. 5, p. 707). It shows that Mr. Hazzard had a total of 746 machines in his factory, of which only 327, or less than 44%, were obtained from the United Company. Counting as United Company machines only those which it leases only (that is, excluding General Department machines, which can be bought outright or bought elsewhere and as to which no monopoly is charged), this list shows that Mr. Hazzard had only 296 United Company machines out of a total of 746 machines; in other words, that less than 40% were United Company machines. This list further shows that Mr. Hazzard had 258 machines in his stitching-rooms of which only 8 were obtained from the United Company.

Jonathan Brown & Sons manufacture McKay shoes, the class of shoes most largely made in the United States. Mr. Brown stated that he wished every machine in his factory was under the control of the United Company on account of its service (R. Vol. 1, p. 731, lines 3–12). He, therefore, took as many United Company machines as he could use. A list of the machines in his factory is given in Plaintiff's Exhibit 269 (R. Vol. 4, p. 1441). This list shows that out of a total of 424 machines only 128, or 30%, were obtained from the United Company. Excluding from the list of United Company machines General Department machines, which could be bought outright from the United Company, or bought elsewhere and as to which no monopoly is charged, the list shows that only 64 machines, or 15%, were United Company machines (R. Vol. 4, p. 1446). This list further shows that out of 191 machines in the stitching-rooms only 6 were obtained from the United Company.

Charles H. Jones, a witness for the United States, testified that his company, the Commonwealth Shoe and Leather Company, had an output of between 6,000 and 7,000 pairs a day, mainly men's welt shoes with a few pegged and Standard Screw shoes (R. Vol. 1, p. 105). A list of the machinery in the factory of this company is given in Plaintiff's

Exhibit 279 (R. Vol. 4, p. 1557). This list shows a total of 1,316 machines, of which only 584, or 44% were obtained from the United Company. Mr. Winslow showed, however, that Mr. Jones had included in this list as obtained from the United Company 73 hand tackers, which are not machines at all, but merely hand tools without power and similar to a hammer, and 41 attachments placed on other machines (R. Vol. 1, p. 976). Deducting these 114 tools and attachments leaves only 470 machines obtained from the United Company out of a total of 1,202, or less than 40%. Deducting the 119 General Department machines which could be bought outright (R. Vol. 1, p. 976, lines 37–40), leaves only 351 machines obtained from the United Company, or less than 30%. This list further shows that out of 465 machines in the fitting-room only 8 were obtained from the United Company.

The International Shoe Co., one of the largest in the world, did not take more than 50% of its machines of the United Company (R. Vol. 1, p. 183, lines 37–42).

The machines manufactured by the constituent companies, as we have said, occupied a comparatively small portion of the entire shoe machinery field. As to the comparative size of this field, Mr. Winslow testified,—

> "The ratio of the machines of the constituent companies to all shoe machines in 1899 was 26 to 138; that is, in round numbers there were 26,000 of United Company machines and 112,000 of machines of other companies, a total of 138,000 in 1899" (R. Vol. 1, p. 452, lines 11–15).

The machines of the Goodyear Company were used wholly for making welt and turn shoes. The manufacture of welt shoes increased enormously after 1899, namely, from 22,700,000 pairs out of a total of 172,786,000 pairs to 86,231,000 pairs out of a total of 278,916,000 pairs (Defs.' Ex. 215, R. Vol. 1, p. 424). The number of auxiliary machines also greatly increased. In 1899 only about 50% of the shoes made were lasted by machines, while to-day practically all shoes are so lasted. In spite of this, the percentage of machines of the kind previously put out by the constituent companies as compared with other machines increased very slightly. Mr. Winslow testified:—

"On the nearest date to the beginning of this suit for which I was able to make a compilation there were 41,602 machines of the Goodyear, heeling, lasting, and metallic departments, compared with 181,000 of all kinds of machines, a ratio of 41 to 181. In this comparison I did not include lasting or metallic auxiliaries, because they are more devices than machines.

"In round numbers the United Company's machines in 1899 were about one in every five and a quarter, and in 1910 about one in every four and a half" (R. Vol. 1, p. 452, lines 16–24).

Defendant's Exhibit 235 (R. Vol. 5, pp. 531–671) sets out each consecutive operation in the manufacture of eight different kinds of shoes most commonly made, viz.: men's McKay sewed shoes, women's McKay sewed shoes, men's welt shoes, women's welt shoes, women's turn shoes, men's loose-nailed shoes, surface standard screwed shoes, and channel standard screwed shoes. It gives under the heading of each operation the name of the machine furnished by the United Company, where it furnishes the machine for performing the operation, and also the names of other concerns furnishing machines for performing the same operation. An examination of this list will show that for practically every operation performed by machines for which work the United Company furnishes a machine there is a competitor, and in most cases there are numerous competitors, prepared to furnish machines for performing the same work. This list further shows that in the manufacture of a man's Goodyear welt button shoe in a factory where the counters are made by the manufacturer, there are 157 different operations of which 44 are performed by hand leaving 113 different operations performed by machine. The United Company furnishes no machines for 35 of these operations. When the shoes have no buttons and the counters are not prepared by the manufacturer there are 94 machine operations, and the United Company furnishes no machines for 22 of these operations. The United Company has no machines for 35 operations which may be performed by machines in the manufacture of a woman's McKay button shoe.

Defendants' Exhibit 336 (R. Vol. 5, pp. 849–905) is a list of shoe machinery manufacturers or dealers setting out the

machines they offer for sale taken from Defendants' Physical Exhibits 311 to 321, which consist of catalogues, letters, and advertisements of such manufacturers and dealers. It shows over 125 different manufacturers and dealers offering every kind of machine, a number of them offering complete lines of machines.

3. The United States of Record Limited its Charge to a Monopoly of Machines for Preparing and Attaching the Bottoms to the Uppers of Shoes, Eyeletting Machines and Clicking Machines.

The evidence having utterly failed to support the charge of a monopoly of all shoe machinery, the United States, as stated above (*supra*, pp. 11–15), admitted during the course of the trial that the United Company did not have a monopoly of all shoe machinery. It conceded of record that it limited its charge to a monopoly of—

> "machines for preparing and attaching the bottoms to the uppers of boots and shoes, the eyeletting machines and the clicking machines" (R. Vol. 1, p. 839, lines 13–22).

While a considerable number of the General Department machines, of which the United Company makes 172 different kinds, are used in preparing the bottoms of shoes, Mr. Smyth, counsel for the United States, at the first argument before this Court further limited the field of the monopoly charged by disclaiming any charge of monopoly of General Department machines. He said, according to the stenographic report of his argument:—

> "Something has been said about the General Department machines. We make no question with respect to them, and they are not involved in this law suit."

The foregoing concessions of the United States limit the charge of monopoly to a comparatively few machines. Thus there are excluded from the charge of monopoly the following machines:—

(*a*) All machines for sewing and preparing the uppers of shoes, including sewing, buttonhole, and other machines which are not manufactured by the United Company at all.

This excludes a large portion of the machines used in any factory. For example, in R. P. Hazzard's factory, containing a total of 746 machines, there were 245 machines in the stitching-room alone which were of this character and which were not furnished by the United Company (see Defs.' Ex. 262, R. Vol. 5, p. 707).

(*b*) All General Department machines, of which the United Company manufactures 172 different kinds.

(*c*) All lacing, treeing, and various other miscellaneous machines used in every shoe factory.

It limits the charge of monopoly to a monopoly of the kinds of machines manufactured by the constituent companies, namely, Goodyear Department, that is, welting machines, lasting machines, heeling machines, metallic machines, and pegging machines, and the following machines which have since its formation been invented or put out by the United Company, viz., clicking machines, eyeletting machines, pulling-over machines, and McKay Sewing Machines.

In considering the charge of a monopoly in this limited field we submit that the record shows:—

1. That the United Company has not an actual monopoly of these machines, but, on the contrary, that there are active competitors ready to furnish machines for performing any and all of the operations for which these machines furnished by the United Company are adapted;

2. That whatever portion of the field of shoe machinery the United Company enjoys is due to the excellence of its machines, which are patented and cannot be manufactured by others,—in other words, to its lawful patent monopolies; to the excellence of its service rendered with its machines, which no other company renders to any satisfactory extent; to its satisfactory business methods and the reasonable terms it offers which have appealed to shoe manufacturers (as Charles H. Jones, a witness for the United States said, "The terms which the Machinery Company have recently

offered their patrons on certain lines of machinery are so liberal that the outsiders cannot compete" (P.'s Ex. 147, Vol. 4, p. 1074); to the fact that the United Company has specialized in certain lines of machines, notably those for making Goodyear welt shoes, has instructed, encouraged, and assisted manufacturers in their manufacture and so has created almost entirely the market which they supply.

Each of the constituent companies, due to the patents held by them, manufactured at the date the United Company was formed practically all the machines of the kind it made which were used in the country. The United Company has therefore not acquired any monopoly of the machines which were manufactured by the constituent companies, but has, by continuous patent development, merely continued the monopoly already lawfully acquired and held by the constituent companies under their patents.

4. Machines for Preparing and Attaching the Bottoms to the Uppers of Shoes, Eyeletting Machines and Clicking Machines can be obtained of Numerous Competitors of the United Company.

The record shows that shoe manufacturers do not take the United Company's machines of the classes enumerated above as to which the United States charges a monopoly because they cannot obtain machines for performing the same work elsewhere. There are competitors ready to furnish these machines to any manufacturer desiring them.

Mr. Winslow testified:—

> "Some of the companies which I have named, like the Hamel Company, Haverhill Shoe Machinery Company, and the R. H. Long Company, are larger than any shoe machinery companies doing business in the United States or anywhere else in 1898, except the three companies which came into the United Company; and they are better fitted to build machines and do build to-day a larger number of different kinds of machines than any concern in

existence in 1899, including the three companies that went into the United Company. It is generally true of shoe machinery manufacturers doing business just prior to the bringing of this suit, as compared with the outside manufacturers doing business in 1899, that they are larger and are capable of furnishing a more complete equipment to factories" (R. Vol. 1, p. 859, lines 22–34).

"The manufacture of shoe machinery does not require any particular kind of machine tools. The standard machine tools used in manufacturing all ordinary machines are the tools that are used in every factory making shoe machinery" (R. Vol. 1, p. 858, lines 25–29).

One of the most important machines used in the bottoming of shoes is the McKay Sewing Machine. This machine was used to attach the sole to the upper of nearly 40% of the shoes made in 1910 (Defs.' Ex. 215, R. Vol. 1, p. 424). The United Company did not even manufacture this machine for a number of years after its formation nor until 1908. Shoe manufacturers have always been able to obtain it from any one of a large number of dealers in machinery. A list of seventeen American dealers and ten foreign dealers furnishing this machine is set out at R. Vol. 1, pp. 858–9.

Mr. Brown testified that there was no difficulty in buying all the McKay machines he wanted at any time (R. Vol. 1, p. 730, lines 18–22). He had thirteen of these machines, only three of which he had obtained from the United Company (R. Vol. 1, p. 730, lines 23–25). The United Company never in any way interfered with his buying McKay Sewing Machines elsewhere (R. Vol. 1, p. 730, lines 26–30).

In 1909 there were in the principal shoe manufacturing districts 1,488 McKay Sewing Machines, of which 308 were supplied by the United Company and 1,180 by others. In the Lynn District there were 59 McKay machines supplied by the United Company and 367 supplied by others (R. Vol. 1, p. 977, lines 16–31).

John Bulmer, witness for the United States, testified: "McKay Sewing Machines are to be had from about all the shoe manufacturers. They pass through our hands more or less frequently, and we rebuild or repair them and furnish them to others. We have no difficulty in getting them at any time" (R. Vol. 1, p. 908, lines 38–41).

This is the case of the bottoming machine used to attach the sole on the type of shoes made in the largest quantities. It is clear that there are a very large number of manufacturers and dealers ready to furnish the machine and the United Company has furnished only a small percentage of the total machines outstanding.

In respect to other machines of the type of which monopoly is charged, namely, machines for preparing and attaching the bottoms to the uppers of shoes, eyeletting machines, and clicking machines, Defendants' Exhibit 337 (R. Vol. 5, p. 906), compiled from the catalogues, letters, and advertisements of various shoe manufacturers, gives a list of manufacturers and dealers prepared to furnish these machines. Each machine is listed separately and the names of the concerns offering it are given.

Defendants' Exhibit 331 (R. Vol. 5, p. 838) gives a list of concerns putting out welt and turn machines and outsole stitching machines from 1899 to 1911.

Defendants' Exhibit 332 (R. Vol. 5, p. 843) gives a list of Goodyear auxiliary machines and machines which other machinery manufacturers offered for doing the same work.

These lists are too long to copy in full upon the brief. They show the very large number of shoe machinery manufacturers making these kinds of machines and the considerable number of competitors prepared to furnish each kind of machine.

Appendix III to this brief (*infra*, pp. 808–834) gives a summary of the testimony of a large number of machinery manufacturers who furnish machines which compete with the United Company's machines. While a considerable number of them furnish General Department machines which are now excluded from the charge of monopoly, a considerable number furnish machines of the classes as to which the charge of monopoly is limited. Some of these manufacturers are prepared to furnish complete lines of shoe machinery.

C. A. Hamel, who took over the Duplessis Company in 1909, and the Duplessis Company prior thereto, from 1903 to 1909, have done a considerable business in shoe machinery. Hamel testified: "We have a complete set of machines for making turn shoes and a complete set of machines for making

welt shoes" (R. Vol. 1, p. 327, lines 15–16). A list of the number of machines put out by the Duplessis Company and Hamel, as its successor, is given at R. Vol. 1, page 326. It shows that they have put out 148 welt and turn machines (86 in this country and 62 abroad); 61 rapid outsole stitchers (41 in this country and 20 abroad); 90 insole channelers (70 in this country and 20 abroad); 55 loose nailers (24 in this country and 31 abroad); and 35 sluggers (22 in this country and 13 abroad).

Owing to the large capacity of each machine, and, therefore, the small number of machines of each type required in the shoe machinery industry, the above represents a very considerable business compared with the business done by the United Company.

For example, it shows that Hamel and his predecessor have put out since 1903, 35 sluggers. From 1903 to 1913, owing to improvement in capacity of its machines, the number of slugging machines which the United Company had out declined from 1862 to 1838 (Defs.' Ex. 226, R. Vol. 5, p. 424). It shows that Hamel put out from 1903, 148 welt and turn machines. The United Company from 1903 to 1913 increased the number of its welt and turn machines outstanding by only 963 (Defs.' Ex. 226, R. Vol. 5, p. 424). It shows that Hamel put out 55 loose nailers. The United Company from 1903 to 1913 increased the number of loose nailers outstanding by only 838 (Defs.' Ex. 226, R. Vol. 5, p. 424).

R. H. Long, through the R. H. Long Machinery Company, is prepared to furnish a complete line of machines (see Physical Exhibits, R. H. Long Machinery Company catalogues, Defs.' Ex. 72, Defs.' Ex. 73). J. J. Doidge, manager of the company, testified that the company was ready to supply a full line of machinery for welt or turn shoes (R. Vol. 1, p. 345, lines 43–44). The company has practically completed and is ready to furnish the trade with 450 outsole stitching machines, 30 welters, 25 lasting machines, and 4 or 5 heeling machines (R. Vol. 1, p. 345, lines 39–42). It can also supply metallic fastening machines (R. Vol. 1, p. 346, line 1).

The Haverhill Shoe Machinery Company offers a full line of machines.

Edwin A. Webster, a director of the company, testified:—

> "We [the Haverhill Company] undertake to fill the requirements of a manufacturer whatever they are. We advertise that we furnish any manufacturer a full line of all kinds of shoe machinery, whether it is for welts or McKays, or turns or pegs or anything else. We are prepared to make good if our people that manufacture machines don't go back on us" (R. Vol. 1, p. 301, lines 4–9).

The Haverhill Company has put out about 25 heel nailing machines (R. Vol. 1, p. 291, lines 10–11); about 60 or 65 turn channeling machines (R. Vol. 1, p. 291, lines 35–36); and about 65 turn and welt machines of which 13 are in the company's own factories (R. Vol. 1, p. 292, lines 7–9), and various other machines (R. Vol. 1, pp. 291–2). The company has machines with 58 shoe manufacturers of whom 38 also use the United Company's machines (R. Vol. 1, p. 299, lines 4 [illegible]). It has five agents who solicit orders and keep the machines in repair (R. Vol. 1, p. 292, lines 40–42).

In addition there are several foreign firms prepared to furnish complete lines of machines. John Cavanaugh, a salesman of shoe machinery connected with the Boylston Manufacturing Company, and a witness for the United States, testified that the Standard Rotary Machine Company of England and Johnson of Paris are good-sized concerns and manufacture complete lines of machines. The Standard Engineering Company is ready to do business in the United States and he should say the other companies would do so (R. Vol. 1, p. 957, lines 31–40). The Atlas Company of Leipsic manufactures a complete line of machines for welt, turn, and McKay shoes (R. Vol. 1, p. 342, lines 8–9).

Moreover, not only do competitors of the United Company offer complete lines of shoe machinery, but such machines, including machines for preparing and attaching bottoms, obtained from others than the United Company are found in large numbers even in those shoe factories where, generally speaking, the United Company's machines are preferred.

Only three shoe manufacturers, Messrs. Brown, Hazzard and Jones, furnished complete lists of all the machines used in their factories and the source from which each machine was obtained (*supra*, pp. 602–604). Each of these witnesses is a

lessee of the United Company and manufactures from 5,000 to 7,500 pairs of shoes per day. These lists show that Jones has 110, Hazzard 87 and Brown 54 machines, obtained outside the United Company, in the departments or "rooms" for preparing and attaching bottoms. Furthermore, Jones and Hazzard both have three times as many eyeletting machines obtained from others as they have from the United Company (P.'s Exs. 269, 279, R. Vol. 4, pp. 1441–6; 1556–64; Defs.' Ex. 262, R. Vol. 5, pp. 707–711).

That shoe factories can be equipped without using United Company machines is admitted.

The Framingham Shoe Company, owned by R. H. Long, uses no United Company machines, nor does the Buffalo Shoe Company (R. Vol. 1, p. 30, lines 31–38).

Henry P. Guptill, a witness for the United States, whose factory has a capacity of 2,500 to 3,000 pairs of turn shoes a day, and is therefore a large factory, testified he used no United Company machines (R. Vol. 1, p. 290, lines 11–15, 24–25).

Frank Albert Brackett, a witness for the United States, testified that Mr. Henry H. Rogers' factory was equipped to make as many as 1200 pairs per day of men's welt shoes. He said:—

> "We had no machines obtained from the United Company. We got them all elsewhere" (R. Vol. 1, p. 951, lines 28–33).

Mr. Long testified that the Taylor Shoe Company of Lynn used no United Company machines (R. Vol. 1, p. 232, lines 29–31). Mr. Webster, of the Haverhill Shoe Machinery Company, showed that 20 of the 58 shoe manufacturers who used his machines did not use United Company machines (R. Vol. 1, p. 299, lines 4–7).

The Non-Royalty Shoe Company was organized by the Shoe Manufacturers' Alliance, which was opposed to the United Company, for the purpose of operating a factory without the use of United Company machines. Warren F. McElroy, a member of the Shoe Manufacturers' Alliance, equipped the factory. He obtained no machinery from the United Company, except one General Department creasing machine which he bought. A few machines he obtained from

abroad. The factory was equipped to make welt shoes. According to Mr. McElroy's testimony, the Non-Royalty factory made a welt shoe which he considered a better shoe than the Goodyear Welt (R. Vol. 1, p. 194, lines 16–17). The factory was equipped to make 600 to 1,000 pairs a day (R. Vol. 1, p. 194, lines 21–22). The factory closed down in 1913 because of a fire (R. Vol. 1, p. 194, lines 17–18). At that time the machinery was offered for sale though the sale was postponed. A list of the machinery advertised for sale appears in Defs.' Ex. 42 (R. Vol. 5, p. 48).

It did not appear definitely how many shoe manufacturers there are in the United States. The United Company had 1,033 lessees who were shoe manufacturers during the year 1911 (R. Vol. 1, p. 26, lines 38–40). Mr. Donham testified that he did not know how many shoe manufacturers there were in the United States at that time, but should say there were somewhere between 1,300 and 1,500. The census for 1910 showed somewhere in the neighborhood of 1,300 (R. Vol. 1, pp. 26–27), and the petition alleges there were in 1911 about 1,300 (R. Vol. 1, p. 991).

The District Court found that the defendants were not monopolists, saying (R. Vol. 1, p. 1135):—

> "There is no question that the above described development of the United Company's business has resulted in a very great commercial success. Its machines, as was the case with those produced by the component companies in 1899, have ever since been those which shoe manufacturers in general can use to the best advantage and therefore prefer. The increase in the number of its machines in the hands of users has been very large. Nor is there any question that of all the machines, of the kinds to which this case relates, in use when the petition was filed, those of the United Company constituted all but a very small proportion.
>
> "It is nevertheless true that, considering the whole field of machinery for stitching together the bottoms and uppers of shoes, there has all the time been free competition. The use of other machinery to accomplish the purpose has always been open to shoe manufacturers. **In that part of the field of trade in shoe machinery to which the case is now limited as above, the defendants have been not monopolists but competitors. Their only means for holding the field have been legitimate**

means,—better machines. Their specialization in machines for bottoming shoes, and not a monopoly of such machines, has been the cause of their success" (BLACK LETTERS ours).

5. The United Company Lawfully Occupies the Field it Enjoys Under its Patents.

It is of the utmost importance to bear in mind that the United Company's machines are and always have been patented. The United Company, therefore, has a lawful monopoly of these machines. No one else can manufacture machines of this type, and there is a natural presumption that if they are generally or exclusively used this is due to their superiority over other types of machines if such exist and not to any illegal restraint of trade. As said of these machines, by this Court, in *United States* v. *Winslow*, 227 U. S. 202, 217,—

> "The machines are patented, making them is a monopoly in any case, the exclusion of competitors from the use of them is of the very essence of the right conferred by the patents, *Paper Bag Patent Case*, 210 U. S. 405, 429, and it may be assumed that the success of the several groups was due to their patents having been the best."

There is a vital difference between an industry concerned with the manufacture of unpatented goods or machines and an industry in which the product is dominated by patents. In a business free from patents, such as the tobacco or oil business, and the manufacture of cotton or woolen goods, the business is open to any one. It would be surprising to find a single manufacturer refining all the oil, making practically all the cigars, or cigarettes, or all the cotton or woolen goods used in the country. Instantly there would arise a suspicion, if not a presumption, of employment of illegal methods to obtain such a monopoly. Such presumption would be strengthened if it were found that such monopoly were obtained by combining a large number of concerns previously competing which could have continued to manufacture goods if left to operate independently. The same would be true in

the case of an industry in which, though the product was patented, the patents covered minor parts or methods and had no important or dominating influence, so that a manufacturer could enter the business and compete without the use of patented inventions.

In an industry like the shoe machinery industry, however, in which patents dominate the entire situation the inference is quite different. It would be difficult to sell machinery of so old a type that the patents on it have expired. Such machinery would express the stage of development which machines had reached seventeen to twenty years previously, and as the art is comparatively young and has been constantly advancing such machines would be so far inferior to the latest patented machines that there would be little market for them. The manufacturer who can hope to engage in this industry successfully is one who has patents either better than or as good as those of the manufacturer or manufacturers already in the field. Furthermore, even if a manufacturer holds such patents and is therefore able to enter the industry, he must maintain his position by the acquisition or development of new patented inventions, or his machines will rapidly become antiquated and will not be taken by shoe manufacturers. The rapid development of the industry, the remarkable increase in efficiency of improved machines every few years makes this essential.

In such an industry dominated by patents either the inventions originally made completely control the industry and no other inventions are made, except improvements or additions to the original inventions, which are of value only in connection with the original inventions, and, therefore, the original inventors or their successors are the only persons who manufacture the patented product; or one manufacturer's patents are almost inevitably better than the patents held by any other manufacturer and his machines are therefore used almost exclusively. In such an industry, then, it is almost inevitable that one manufacturer will dominate the industry lawfully by reason of his patents until such time as the industry has developed to a point where the important inventions have all been made and the patents thereon have expired, and inventors must confine themselves to minor improvements

and refinements which are not of vital importance. When that point is reached the industry will be open to all; prior to that time it is for practical purposes open only to those having the best patents. So long as it is dominated by patents the fact that the manufacturer who has the best patents produces the larger share of the product does not give rise to any presumption of illegal methods, but is natural and to be expected.

The United States points to the large proportion of the trade in shoe machinery held by the United Company and the fact that shoe manufacturers must turn to it if they wish the best machines as evidence of an unlawful monopoly. This is entirely unjustified. The right of an owner of patents to exclude all others from making use of his inventions and to draw to himself all trade in the patented articles and, as a consequence, to acquire a commanding position in the industry if no other patented articles are equally good is undoubted. This Court in *United States* v. *Bell Telephone Company*, 167 U. S. 224, p. 250, said:—

> "Counsel seem to argue that one who has made an invention and thereupon applies for a patent therefor, occupies, as it were, the position of a quasi trustee for the public; that he is under a sort of moral obligation to see that the public acquires the right to the free use of that invention as soon as is conveniently possible. We dissent entirely from the thought thus urged. The inventor is one who has discovered something of value. It is his absolute property. He may withhold the knowledge of it from the public, and he may insist upon all the advantages and benefits which the statute promises to him who discloses to the public his invention. He does not make the law. He does not determine the measure of his rights. . . . As the law-making power has prescribed what the public will give, specified the terms and conditions of purchase, indicated the time and methods of determining the right of compensation, he on his part has an absolute legal right to avail himself of all the provisions thus made."

No case presenting facts in any way similar to the present has ever before been decided by this Court under the Sherman Act, except the case of *United States* v. *Winslow*, supra, in

which the formation of the United Company and its acquisition of the constituent companies holding patents which gave them a practical monopoly of the business was before this Court and was held lawful. In no other case heretofore decided has the product which the defendant has been accused of monopolizing been protected by dominating patents which restricted competitors to the marketing of machines of a different and inferior type. In practically every case in which the monopoly of an industry has been charged such monopoly has been created by a combination of competing concerns, the combination of which was not necessary to enable the defendant to produce a satisfactory product. In the present case the United Company was a combination of non-competing concerns and its subsequent acquisitions have been mainly of small non-competing concerns of minor importance having little or no influence in the trade, acquired in order to enable the company to give its customers a broader line of machines, or to obtain patents required to improve its own machines. In all cases where such acquisitions were made there were left outstanding competitors (R. Vol. 1, p. 465, lines 20–23).

The presumptions and inferences applicable in other cases are inapplicable in the present case. The combination of non-competing concerns is lawful, no intent can make it unlawful, and it, therefore, can give rise to no unlawful inference (*United States* v. *Winslow*, supra). The defendants' patented machines are presumed to be the best of their kind (*United States* v. *Winslow*, supra), and the fact that the United Company has a large portion of the business of furnishing shoe machinery is therefore natural and gives rise to no inference of unlawful methods.

The District Court said (R. Vol. 1, p. 1136):—

> "The business which the defendants have developed and established is not, and has never been, one in which everybody might freely engage. No one else could lawfully make or use machines containing improvements covered by the defendants' patents. Nor can it be said that the demand for such machines which they have supplied existed independently of the defendants; on the contrary, they have created it by the new methods of

shoe manufacture which their improvements have educated and enabled manufacturers to follow. It cannot justly be said that the case is one in which a field of commerce normally belonging to all has been captured by a single concern. The principles applying in such cases cannot justly be applied here."

6. The Constituent Companies had Lawful Patent Monopolies of the Machines They Manufactured. The United Company has not Acquired Any New Monopoly in These Machines.

If previously to the formation of the United Company the constituent companies had supplied only a small portion of the machines of the kind they manufactured, and there had been competitors furnishing similar machines to a large portion of the shoe manufacturers, and if, after the formation of the United Company, such competitors had disappeared and the United Company had thus acquired all or the greater part of the trade, there might be a presumption or inference that such result was caused by illegal methods which would call for a careful scrutiny of the causes. Such, however, is not the fact. The constituent companies, at the time of the formation of the United Company, had a larger proportion of the trade in the machines they manufactured than the United Company now holds and this was due to the fact that these machines were the best and were protected by patents which prevented others from manufacturing them. The shoe machinery industry was new and the constituent companies, which held the only practical patents, had created the industry, and, therefore, naturally had the greater part of the business.

The petition admits and alleges that the constituent companies had a lawful monopoly of the machines they manufactured. It sets out that the principal essential machines used in the manufacture of shoes are lasting machines, welt sewing and outsole stitching machines, heeling machines, and metallic fastening machines (R. Vol. 1, p. 991). It alleges that the principal concerns engaged in the business were the constituent companies (R. Vol. 1, p. 992). It alleges that

the constituent companies were "manufacturing their machines and parts thereof under Letters Patent of the United States and of other countries" (R. Vol. 1, p. 993). It then alleges that the defendants, "not being satisfied with the benefit of lawful monopolies and rights belonging to them under Letters Patent of the United States and of other countries," formed an unlawful project to unlawfully expand their monopolies and rights (R. Vol. 1, p. 994). Finally it alleges that the United Company, by the acquisition of the constituent companies, "acquired control of the greater portion of the manufacture of, and trade and commerce in, the machines included in each and all of the groups of machines" mentioned (R. Vol. 1, p. 996).

In other words, the petition admits that the constituent companies had patents which gave them lawfully the greater part of the trade in lasting, welt sewing, and outsole stitching, metallic fastening, and heeling machines.

There were other concerns putting out machines, but the constituent companies' machines were the best (R. Vol. 1, p. 532, lines 16–18, 29–32). The constituent companies' machines were doing about all the welting, outsole stitching, lasting, and metallic fastening that was being done in the United States (R. Vol. 1, p. 537, lines 32–37). No other company had put out heeling machines for several years prior to 1899 and the McKay Company was putting out all of the heeling machines that were being made in the United States (R. Vol. 1, p. 851, lines 27–30).

The reason is obvious. The shoe machinery industry was of very recent origin. Previous to 1850 or 1860 all shoes were made almost entirely by hand (R. Vol. 1, p. 521, lines 15–16). Shoe machinery had only been gradually developed since that date, and, as we have shown, many important machines had not been invented in 1899. In respect to the machines put out by the constituent companies, their invention was new, and important improvements were constantly being made in them. The constituent companies held the patents under which they had originally been constructed; they were the ones most interested in developing and improving the machines and they, therefore, developed the machines, and held the patents on the new improvements. The constituent

companies, therefore, had practically all the business as a result of these lawful patent monopolies.

To illustrate: The Goodyear machines were designed to make a welt shoe by machinery. Welt shoes had been made for many years previously, but always by hand. The system ran back to 1870 or 1868 (R. Vol. 1, p. 625, line 20). The Goodyear Company, however, revolutionized its machines about 1890 by the use of new inventions (R. Vol. 1, p. 678, lines 6–9). The auxiliary machines needed to make the system a practical success were only gradually developed and were still in process of development in 1899. The Goodyear Company in 1899 was still endeavoring to introduce its machines into general use. In 1899, after the formation of the United Company, only 22,700,000 pairs of welt shoes were made out of a total production of 172,786,000 shoes (R. Vol. 1, p. 424). In other words, the industry of making welt machinery had been created by the Goodyear Company; no one else had invented machines comparable to the Goodyear machines, so that inevitably the Goodyear Company, by reason of its patents, had practically all of this new field which it had created.

The lasting machine industry was more recent still. In 1890 very few shoes were lasted by machines except heavy brogans, which were, of course, limited in number and which were lasted on the McKay & Copeland machine (R. Vol. 1, p. 401, lines 14–16). Shoe manufacturers at that time were sceptical as to the possibility of developing a lasting machine at all (R. Vol. 1, p. 401, lines 24–26). The industry dates from that period only nine years previous to the formation of the United Company. Even when the machines had become commercially useful the difficulty of introducing them, due to the opposition of operatives, the necessity of instructing operatives in the use of the machines, and the scepticism of shoe manufacturers was enormous (R. Vol. 1, pp. 401–3). In 1899 not more than 50% of the shoes made were lasted by machines (R. Vol. 1, p. 402, lines 14–18). Here again we find the lasting machine industry a new industry created by the Consolidated Company and only partially developed after some years of labor and inventions, and protected by patents. The fact that the Consolidated Company put out practically

all of the lasting machines was no more remarkable than that the Bell Telephone Company, after the invention of the telephone, was the only concern engaged in making telephone instruments.

7. The Other Machines not Manufactured by the Constituent Companies as to which Monopoly is Charged were New Inventions Developed by the United Company and Protected by Lawful Patent Monopolies. Any Monopoly Acquired by the United Company in these Machines was due to the Fact that the United Company Created them and the Fact that they were Lawful Patent Monopolies.

The pulling-over machines were invented by the United Company and first put out in 1902. The pulling-over operation was previously done by hand exclusively (R. Vol. 1, p. 425, lines 33–34). Various auxiliary machines were developed later (R. Vol. 1, p. 12, lines 1–8). The first lease including auxiliaries was put out in 1905 (R. Vol. 1, p. 12, line 9). The pulling-over machine is a remarkable invention and an entirely new creation. Its development cost the United Company nearly $1,000,000 (R. Vol. 2, p. 2552). It had been in existence at the date the petition was filed only nine years (R. Vol. 2, p. 2542). It is protected by 19 patents (R. Vol. 2, p. 2573), and the auxiliary machines are protected by over 28 different patents (R. Vol. 2, pp. 2523–5, 2572–4. See pulling-over system lease, P.'s Ex. 39, R. Vol. 3, pp. 363, 364). The fact that no one else had developed or invented a different type of machine which was as satisfactory to shoe manufacturers and in genera luse is therefore not remarkable; on the contrary, it would be surprising if any one had done so.

The clicking machine was another remarkable invention developed by the Experimental Department of the United Company, which probably saves more money for the shoe manufacturer than any machine ever produced (R. Vol. 1, pp. 425–6). It was first made commercial in 1908 and was then first leased (R. Vol. 1, p. 14, lines 30–33; Vol. 2, p. 2589). The machine cuts out the uppers of shoes in such a way as to effect an enormous saving of leather; previously to its invention the shoe manufacturer generally cut the upper by a hand

knife, resulting in a considerable loss of stock (R. Vol. 1, p. 426, lines 2–24).

Mr. Winslow testified:—

> "The clicking machine was another machine which was developed by the Experimental Department of our company and perhaps saves more money for the manufacturer than any other machine which has been produced" (R. Vol. 1, pp. 425–6, lines 43–44, 1–2).
>
> "Since my knowledge of the shoe art no machine has accomplished so much for the art as the clicking machine" (R. Vol. 1, p. 426, lines 19–20).

This machine had been put out less than four years before the present petition was brought. It is protected by 13 patents (R. Vol. 2, p. 2598). George Harsh, witness for the United States, testified that the United Company's clicking machine was the only commercial machine in the market (R. Vol. 1, p. 198, lines 30–32). It is obvious that the success it had was due to its merit and that the large trade in this machine which the United Company had was due to the lawful patent monopoly which prevented its manufacture by others.

The United Company's eyeletting machines were likewise patented machines developed by it (R. Vol. 1, p. 14, lines 21–23). The Duplex machine, which is the standard machine for regular work, was first put out in 1902 (R. Vol. 2, p. 2617). It is protected by 12 patents (R. Vol. 2, p. 2617). It is the only machine ever produced which inserts eyelets on both sides of the shoe at once (R. Vol. 2, p. 2618). The Universal machine is another type likewise adopted in 1902 and it is now protected by five patents and one patent application (R. Vol. 2, p. 2636). As to the McKay sewing machine, while the United Company acquired a business of manufacturing this machine, it clearly has no monopoly, as such machines can be obtained of many machinery dealers. Such success as the United Company has had in furnishing this machine is due to the fact that it is putting out an improved patented machine (*supra*, p. 297; R. Vol. 1, p. 83, lines 9–15; P.'s Ex. 170, Vol. 4, p. 1161).

The above list includes all the machines as to which monopoly is charged by the United States.

From the foregoing it appears that the constituent com-

panies of the United Company, at the time of the formation of the United Company, furnished practically all the welt and turn machines, lasting machines, metallic fastening machines and heeling machines used in the country. The trade in these machines had only recently been created by inventions which made the machines possible, and the constituent companies held the best of the patents covering these inventions. Such monopoly as they had resulted lawfully from the patents. The United Company, therefore, did not acquire any new monopoly in these machines; it merely continued the lawful monopoly, if it can be called such, held by the constituent companies. The charge of the United States that the United Company acquired a monopoly is absolutely unfounded. The only possible contention the United States could make is that the United Company maintained this monopoly by unlawful methods.

In respect to the pulling-over machines, clicking machines, and the eyeletting machines, it appears that they were developed by the United Company, that the United Company had a lawful and inevitable monopoly in these machines when first put out, because the United Company held strong patents covering them and no one else had invented any other machines to do the same work. Here again the original acquisition of the business by the United Company was unquestionably lawful, and the only possible contention that the United States can make is that these lawful patent monopolies have in some way been illegally maintained.

As to the McKay sewing machines, the United Company obviously has no monopoly (*supra*, p. 609).

8. The United Company has Maintained the Business in Shoe Machinery which it Acquired, not by Unlawful Methods, but by Reason of the Excellence of its Patented Machines and the Service it Renders with Them.

We have shown above that the United Company lawfully acquired its business in the machines as to which a monopoly is charged. We submit the record shows that this business has been maintained by lawful methods.

The business was acquired by reason of the patented inven-

tions held by the United Company and its constituent companies. The development of the machines since that date has been constant; the United Company has spent enormous sums in invention and development of machines and to-day the United Company has as strong if not stronger patents on its machines than it had in 1899 or has had at any time since (*supra*, pp. 187–190, 217–225). There is absolutely no evidence that other persons have invented better machines or equally good machines. If the United Company's patents in 1899 gave it most of the business in the machines which it manufactured, there is every reason that its patents should have enabled it to retain this business.

In addition, however, the United Company has developed a service in connection with its machines at enormous cost to itself, which has proved of the utmost importance to shoe manufacturers, which is given by no other shoe machinery company and which shoe manufacturers testified was vital (*supra*, pp. 178–185). It has in no instance increased its charges for machines; on the contrary, it has in certain instances reduced its royalties and it has removed the initial premiums charged in 1899 (*supra*, pp. 191, 192, 196). It has furnished new machines as they have been invented, free of charge, taking back the old machines, and it has added many important auxiliary machines without additional charge (*supra*, pp. 189–190, 195–196).

By these various means it has added enormously to the efficiency and usefulness of its machines. If owing to their excellence they were used almost entirely by shoe manufacturers in 1899, there is still more reason they should be so used to-day.

We submit that the United States has wholly failed to show that the United Company's continuance of the success of the constituent companies has been due to the acquisition of competing concerns, or to the effect of its leases.

That this is true is proved conclusively by an examination of certain machines as to which monopoly is charged.

Take, for example, eyeletting machines. The record does not show a single instance in which the United Company has acquired any eyeletting machines or any company dealing in eyeletting machines. Obviously the success of the United

Company in furnishing eyeletting machines has not been due to the acquisition of competitors. The eyeletting machines under one form of lease are restricted to use with certain other machines, but not a single lease of such other machines restricts them to use with the United Company's eyeletting machines. The shoe manufacturer can take any machine he pleases from the United Company under a restricted lease and use it with a competitor's eyeletting machines. Obviously the restricted clauses in the leases of other machines have not compelled or induced a use of the United Company's eyeletting machines. Whatever success these machines have had must, therefore, be due solely to the excellence of the machines and the service rendered with them.

The same is true of the clicking machines. No acquisition of any competing clicking machine has ever been made, nor is any other machine restricted to use with the clicking machine. Its success cannot have been due to the acquisition of competitors or to the fact that lessees are induced or compelled by restrictive clauses in the leases of other machines to use them.

The same is also true of the pulling-over machines. The United Company has never acquired a competitor putting out pulling-over machines. The only acquisition has been that of the Seaver Experimental Pulling-over Machine, which stood in the way of the development of the United Company's machine (Appendix I, p. 673). The only machine restricted to use with the pulling-over machines is the No. 5 Lasting Machine; but this is a comparatively new machine, and shoe manufacturers can use hand method machines for their lasting. The result is that the success of the United Company's pulling-over machines has not been due to the acquisition of competitors or the restrictive clauses in the leases.

The same is true of the Goodyear welt and turn auxiliaries, of which 43 different kinds are furnished by the United Company. No acquisitions of competing concerns furnishing these machines have been made which are of the slightest significance, and no other machines are restricted to use with these auxiliary machines.

Although the United Company has acquired the Richardson Company's patents on an improved McKay sewing machine, because such patents would improve its machine, and be-

cause the United Company's machine infringed such patents (see Appendix I, pp. 722, 723), and although the United Company acquired the Stanley Company's business of manufacturing McKay machines, it did not thereby acquire any monopoly in the manufacture of McKay machines, since they can at any time be obtained from a large number of machinery dealers (*supra*, p. 609). No other machine put out by the United Company is under any form of lease restricted to use with the McKay machine, so that no shoe manufacturer is compelled or induced to use the McKay machine by reason of the restricted clauses in the leases of any other machines.

The result is that obviously the success of the United Company in furnishing eyeletting, pulling-over, clicking, Goodyear auxiliary, and McKay sewing machines has not been due to the elimination of competitors or to the restricted clauses in the leases.

The only other machines as to which monopoly is charged are the welter, stitcher, lasting, metallic, heeling, and pegging machines. As to all these machines it is admitted that the constituent companies had lawful patent monopolies in 1899 and no other persons were furnishing such machines to any material extent. To-day good-sized competitors are furnishing them.

If the United Company's success in furnishing eyeletting, clicking, pulling-over, Goodyear auxiliary, and McKay sewing machines has clearly been due to the excellence of its machines and service, and not to the elimination of competitors or the restricted clauses in the leases, it would take strong evidence to prove that such success as the United Company has had in maintaining the business of the constituent companies in welters, stitchers, lasting, metallic, heeling, and pegging machines has not been due to the same causes, but, on the contrary, has been due to the elimination of competitors and the effect of the restricted leases. The failure to show any elimination of competitors, the limited effect of the restricted leases, and the offer on the part of the United Company of unrestricted leases to all who desire them, justify no contention that this success has been due to the elimination of competitors or to the restricted leases.

We submit that whatever view may be taken of the acts

in evidence in this suit, whether any of them considered individually are deemed lawful or unlawful, the fact is clear from the record that the excellence of its patented machines which gave the constituent companies their success, coupled with the great improvement in the machines effected by the United Company, and the service it renders with them, is the cause of the success of the United Company to-day. The District Court so found, saying:—

> (R. Vol. 1, p. 1135.) "There is no question that the above described development of the United Company's business has resulted in a very great commercial success. Its machines, as was the case with those produced by the component companies in 1899, have ever since been those which shoe manufacturers in general can use to the best advantage and therefore prefer. The increase in the number of its machines in the hands of users has been very large. Nor is there any question that of all the machines, of the kinds to which this case relates, in use when the petition was filed, those of the United Company constituted all but a very small proportion."
>
> . . . . . .
>
> "If there is any sense in which the result attained as above can be called a 'monopoly,' it does not follow, in view of the circumstances shown, that the defendants have either restrained trade or been guilty of monopolizing, or attempting to monopolize, within the meaning of the act. Nor can I regard the case as one in which any presumption arises, from the fact that so large a proportion of the users of these machines use the defendants'—that the defendants have committed any of the above forbidden acts in accomplishing the above result. The proof is too complete that it has been in fact reached by the use of methods entirely lawful, the leading features whereof are below indicated."
>
> . . . . . .
>
> (R. Vol. 1, p. 1137.) "That the degree of success attained and the preponderance in number of users supplied which the United Company has secured are fully accounted for by the superior efficiency it has developed in its patented machines for work in combination with each other, together with the superior facilities it affords as above for their most efficient use, must be regarded as shown beyond question. It is not disputed that, when the petition was filed, its machines represented, in number and

amount, the highest development ever reached in the art to which they belong; or that they are most in demand by manufacturers of the higher grades of shoes for that reason."

. . . . . .

(R. Vol. 1, p. 1187.) "It is impossible to believe that the defendants' equipment is in so many shoe factories for any other substantial reason than the merits of what they have had to offer. To say that this is due, in any substantial degree, to the fact that its leases run beyond the terms of patents, or because of the exclusive use, prohibitive or cancellation clauses, rests largely, if not entirely, upon assumption. But that the business of these defendants rests upon the lease provisions objected to in such a substantial amount as to constitute any factor of independent force in securing or maintaining a monopoly does not appear."

XI.

RELIEF ASKED FOR BY THE UNITED STATES.

The Impossibility of Granting the Relief asked for by the United States without Irreparable Damage to the Public proves the Lawfulness of the United Company's Business.

The petition prays:—

1. That the United Company and the United Shoe Machinery Corporation "be dissolved and separated into such parts that no one of them will constitute a monopoly" (R. Vol. 1, pp. 1030–1); and

2. That the leases of the United Company containing like or similar provisions to those complained of be declared illegal and void and the defendants be enjoined from enforcing such provisions (R. Vol. 1, pp. 1029–30).

The petition prays for other incidental relief, but the foregoing is the primary and material relief requested.

1. A Separation of the United Company's Business would Irreparably Damage Shoe Manufacturers and the Public.

In the case of the American Tobacco Company, the Standard Oil Company, and other companies in which dissolution has been ordered by this Court, or by the lower courts, the business dissolved has consisted of an accumulation of different manufacturing plants and businesses, each of which, if separated, would or might compete with all or a part of the others. When separated, they could continue to carry on separately and in competition the business previously conducted by the company which was dissolved. As a result of such dissolution, each of the companies among which the business was divided had its own plant or plants in which to

manufacture its goods and the same class and character of goods as previously could be manufactured, and the only difference has been that competition between these separate companies into which the business was divided was created.

In the case of the United Company no such situation exists or can be created.

1. In the first place, the business of the United Company as to which monopoly is charged consists in manufacturing a variety of patented machines. No two machines which it manufactures compete with each other in any practical sense. In practically no case has it two distinct machines each protected by its own patents which do the same work and are, therefore, capable of competition. In certain cases there are two types of machines for doing similar work, but they are used for different purposes or they embody to a considerable extent the same patents. For example, the welt leveler is used exclusively for welt shoes, and the McKay leveler is used exclusively for McKay shoes, and neither can be used to do the work of the other, and, therefore, they are not capable of competition. In certain other cases there is a new improved model and an older model, but in such cases the new model is not only superior to the old model so that the old model is becoming obsolete, but it almost invariably embodies some patents which are also embodied in the old model.

In other words, the business of manufacturing each of the machines which the United Company produces cannot be carried on without the ownership of the patents embodied in the machine and under which it was created. It would be utterly impossible, therefore, to transfer to two or more separate companies the right to manufacture any one of these machines and thereby create competition without cancelling the patents under which such machine is manufactured.

2. In the second place, the United Company has a single manufacturing plant at Beverly, where all its machines of any importance are manufactured. The only other plants which it controls are a small plant for making treeing machines (O. A. Miller Treeing Machine Company), a small plant for making fudge edge and beading machines (owned by the Booth Brothers Company), and plants for making supplies, such as eyelets, blacking-brushes, etc. If the Beverly factory

were retained and these other small plants were transferred to a separate company or companies, such company or companies would not thereby be placed in a position to manufacture shoe machinery.

The United Company's plant at Beverly, which is the only factory owned by the United Company which is used or suitable for manufacturing shoe machinery on any scale, and the only factory which has the tools and patents for manufacturing the machines as to which monopoly is charged, is a single plant with a single foundry and designed for use by a single concern. If the United Company were divided into two or more companies, it would, therefore, be necessary for one to take the plant at Beverly and for the other company or companies to obtain new plants.

A division of the United Company's business could be attempted in only one of three different ways,—either

(1) By dividing the business into its original component parts, that is, by dividing the business of two or more non-competing concerns, each of which took the patents covering certain distinct types of machines; or

(2) By attempting to divide the business among two or more competing concerns, each of which took one or more of the patents covering each machine; or

(3) By attempting to compel the United Company to dispose of all machines and businesses which the United States contends were unlawfully acquired since its formation in 1899.

If an attempt were made to divide the business into its original component parts or into other non-competing groups, that is, if the Goodyear business acquired from the Goodyear Company were set apart in one company, the lasting machine business acquired from the Consolidated Company in another company, the heeling and metallic machines acquired from the McKay Company in another company, and the new machines, such as the pulling-over machines, clicking machines, eyeletting machines, and General Department machines invented by the United Company, or acquired since the formation of the United Company, were set apart in still another company, we should have four non-competing companies. These companies could, unless enjoined, consolidate

again because it would be entirely lawful to do so, as held in *United States* v. *Winslow*, supra. No competition would be created by such a division and no beneficial result would be accomplished. On the contrary, the public would lose the benefit of the increased efficiency which results from the consolidation in one company of these different types of machines, such as better service to shoe manufacturers, the maintenance of a large experimental department, wholesale prices, and reduction of expenses.

If an attempt were made to divide the business of the United Company into competing concerns, this could only be done by taking each machine separately and transferring to one company a portion of the patents covering the machine and to another the remainder of the patents covering it. A division of the patents covering a machine between two concerns would, of course, make it impossible for either to manufacture the machine as now manufactured. Suppose, for example, the Court should order that one-half the patents on the welter or pulling-over machine should be sold or disposed of. Neither the United Company, which retained half the patents, nor the vendee of the other half of the patents, could make the welter or pulling-over machine as it is now manufactured and put out. The result would be disastrous to the industry, as it would necessarily mean far less efficient machines, or in some cases that no machine at all could be manufactured without infringement.

Nor would a better result be accomplished if the Court should order that the acquisitions which the United States contends are unlawful should be disposed of.

The sale by the United Company of the concerns manufacturing supplies which it has acquired would certainly not create competition in shoe machinery. Nor would it create competition in such supplies, since the United Company has not acquired two or more competing concerns of this character. Upon the sale of the business of supplying peg-wood, blacking, eyelets, etc., the result would merely be that shoe manufacturers would be deprived of the benefit of obtaining these supplies from the United Company's various service stations, and would likewise be deprived of the right to obtain them at the prices which the United Company is able to quote

because of the fact that it has an established organization in constant touch with shoe manufacturers through which it can furnish these supplies with comparatively little additional expense.

Take the acquisitions of machines which the United Company was not manufacturing until such acquisition. If the United Company should sell these machines and the patents covering them, no competition would be created, as the United Company would have no machines left to compete with. The result would merely be that the shoe manufacturers would probably have to pay more for the machines and would get a poorer service with them, as the United Company with its large factory can manufacture these machines more cheaply and on account of the number of machines it puts out can furnish service more economically than would be possible for a purchaser of these patents.

Take the acquisition of patents which were acquired to be embodied in machines which the United Company was at the time producing or developing. If these patents were sold, the United Company would be unable to manufacture machines containing the improvements protected by these patents. On the other hand, the purchaser of these patents would not be able to manufacture the machine now produced by the United Company which embodies other patents, which the United Company would retain.

An examination of our discussion of the acquisitions (*supra*, pp. 436–490) will show that none of the businesses, patents, or machines acquired by these so-called acquisitions could be sold so as to benefit the public and create competition.

In a number of cases the particular machine the acquisition of which is criticised by the United States, has become entirely obsolete, and if any competition did exist, which we deny, none could be created by selling such machine or the patents covering it.

For example, the Ideal Machine and the Eppler Machine, acquired in the original organization of the United Company are now both obsolete. Anybody is free to manufacture these machines to-day, as the patents under which they were made in 1899 have expired; but nobody does manufacture them, because nobody wishes to use them. There are no patents cov-

ering these machines to sell and no business of manufacturing them to dispose of.

Take the patents acquired from the Richardson Shoe Machinery Company (see Appendix I, *infra*, p. 722). Those patents covered inventions which the United Company did not have and which it has embodied, together with many of its own inventions, in its new Model K Welter, its new Model M Outsole Stitcher and the new McKay Sewing Machine which it has produced since those patents were acquired; and its Model B McKay Sewing Machine infringed one of those patents. If the United Company sold those patents it would no longer be able to supply machines embodying those improvements. The purchaser, on the other hand, would not be able to supply machines nearly as efficient as the United Company's machines in which those improvements have been embodied because they have been combined with many other important improvements which have been developed by the United Company and which are covered by its patents. The result of such a sale would merely be to reduce the efficiency of existing machines.

Take the Plant acquisition. A sale by the United Company of the Plant patents would prevent its manufacturing the improved Model K Welter, which is enormously more efficient than either the former Plant welter or the former United Company welter. The loss to shoe manufacturers would amount to hundreds of dollars a year on each new machine. Such sale of the Plant patents would also mean that patents on 26 machines now put out by the United Company would be transferred and the United Company would have to give up the manufacture of these machines or would have to remodel them materially to avoid infringement of the transferred patents and thus make them far less efficient. On the other hand, it is extremely doubtful if the grantee of the patents would attempt to manufacture under them. If he did, he would be unable to manufacture efficient machines which he could market, or if he did make efficient machines he would infringe patents of the United Company which must be combined with the Plant patents to make efficient machines.

These instances are typical of all the acquisitions of patents for shoe machinery or machines.

The fact that the United Company's business cannot be separated without such consequences proves conclusively that its creation was inherently lawful and for the purpose of greater efficiency and to enable it to furnish more efficient machines.

The Sherman Act, as we have shown, is intended to prevent "not the mere injury to an individual which would arise from the doing of the prohibited acts, but the harm to the general public which would be occasioned by the evils which it was contemplated would be prevented."

Wilder Mfg. Co. v. *Corn Products Co.*, 236 U. S. 165, 174.

It may possibly be true that if the United Company's patents should be distributed among two concerns, neither of which held all the patents on one machine, and neither of which was therefore able to make the latest improved machines, competitors of the United Company would be benefited. Shoe manufacturers and the public generally, however, would be disastrously affected. The Sherman Act was never intended to produce such a result.

In *United States* v. *St. Louis Terminal*, 236 U. S. 194, the decree of the lower court in a suit under the Sherman Act enjoined the defendant company from doing a transportation business which originated and terminated on its own lines. This Court held that the decree should be qualified so as to recognize the defendants' right to do such business (p. 205),—

> "Because not to so decide would lead inevitably to the conclusion that the decision of this court contemplated safe-guarding one public interest by destroying another and in effect proposed making the movement of transportation freer in some channels by absolutely obstructing all possibility of its flow in others."

2. To Hold the Leases Void would disastrously Affect Shoe Manufacturers and the Public.

The United Company owns the leased machines, and shoe manufacturers are only entitled to hold them under the lease and license agreements under which they were placed in such lessees' factories. If the leases were held void, lessees would

no longer have a right to retain or use the machines now held by them until they made a new agreement with the United Company permitting them to do so.

But if the leases were held void because the provisions now contained in the leases are illegal, the United Company would necessarily be unable to permit the use of its machines on the favorable terms on which lessees now hold them.

Under the present system the shoe manufacturer obtains the machines practically without initial cost, and, apart from nominal rentals charged for certain auxiliary machines, the shoe manufacturer pays for the machines only to the extent that he uses them. Such an arrangement is possible only when the lessee agrees to use the machines if he has work for them to perform. Otherwise valuable machines would be placed in the lessee's hands and he would be under no obligation to pay anything to the United Company if he did not choose to use them. But if the Full Capacity Clause were held illegal, the lessee could not be asked to agree to use the machines and, therefore, the United Company could not let him have them on the present terms. It would be obliged either to sell the machines or charge a large initial payment or a fixed annual rental sufficient to compensate it for the machines and payable whether the lessee had work for the machines or not.

If the United Company should therefore determine to sell its machines or charge a large initial payment, the result would be that the shoe manufacturer whose capital is small might be unable to make the payments required of him and therefore be unable to continue in business, or if he did succeed in making the payments he might find himself with insufficient quick capital to conduct his business properly. Small manufacturers without sufficient capital to pay for their machines would be unable to enter business in the future, as they can now do.

If a fixed rental should be charged it would necessarily be based on the capacity of the machines. This again would injure the small shoe manufacturer. If he made only 200 pairs a day, as many shoe manufacturers do, he would have to pay for a machine like the heeling machine, which has a capacity of over 1,200 pairs per day, as much as the large manufacturer making 1,200 pairs per day and using the machine to its full capacity would have to pay.

Under the present system a shoe manufacturer using a series of machines gets the benefit of the reduced price which the United Company is able to offer when such a series is used. If the Restricted Use Clause were forbidden and the United Company were forced to lease each machine separately, regardless of whether it were to be used separately or not, the royalty or price charged would have to be based on the cost of caring for and the probable return from each machine if used separately, and not as part of a series of machines.

It is obvious, as we have shown, that a series of machines, for example, a welter, stitcher, 10 auxiliaries, lasting, heeling, and metallic machines, can be cared for more economically and will return more revenue if used together in one factory than if each machine is in a separate factory in a separate place. Yet, if the Restricted Use Clause were forbidden, the shoe manufacturer taking the series of machines would have to pay for their use a price which would be the total charge if he took each machine separately. The shoe manufacturer using the series would therefore be charged more than he pays at present.

Most of the United Company's customers, as many of them testified, consider the United Company's machines the best made and prefer to take the entire series. These shoe manufacturers would necessarily suffer.

If the United Company cannot protect itself by the Exclusive Use Clause permitting it to take back its machines if others of the same kind are used and for this reason it does not get a fair return, if it cannot protect itself by the Cancellation Clause permitting it to cancel its leases if the lessee violates his agreements, and if it cannot protect itself by the Repair Clause requiring the lessee to use in repairing its machines parts which are made for them and which it knows are proper, the United Company cannot put in its lessees' hands millions of dollars worth of machinery without charging an initial payment sufficient to cover possible losses arising from these various contingencies.

If the seventeen-year term is held illegal and the United Company is forbidden to enter into an agreement to lease the machinery for an extended term, the United Company cannot afford to construct expensive machinery to be placed

without charge in the hands of its lessees, which might be returned for some whim of the lessee after a short period.

The present remarkable system of leasing machines without initial payment, to be paid for only as used, is made possible only by the use of these clauses or similar clauses which are essential to the protection of the lessor. It is inevitable that if these clauses were held illegal the United Company would be obliged to abandon the lease system entirely or charge very large initial payments and also charge more for each machine though used as part of a series than would be charged if it could lease the series as a whole. Such a result would be a misfortune to the shoe manufacturing industry. The cost of machinery would increase and many manufacturers of small capital would be unable to retain their machinery or to obtain all the machinery they need for the most efficient conduct of their business and many men of small means would be debarred in the future from entering into business at all. The only persons who would be pleased would be a few large shoe manufacturers who object to the present system because it enables the small manufacturer to enter business and compete, and who do not care what they pay for their machines (provided it does not exceed the amount paid by others) if they can eliminate the competition of the small manufacturers which has been encouraged by the United Company.

3. If the Clauses in the Leases Objected to by the United States are Illegal, the Leases as a Whole must necessarily be Void.

Counsel for the United States seeks to avoid the foregoing consequences in the following way. Although the petition prays that all leases containing these clauses "be declared illegal and void" and their enforcement enjoined (R. Vol. 1, p. 1029), counsel suggested at the former hearing of this case that they did not ask that the leases be declared void, but only asked that the United Company be enjoined from enforcing the clauses objected to. In this way they suggest shoe manufacturers may retain their machines without paying more than

at present and be freed from all these provisions which pro ect the United Company. In other words, they submit that such a decree would work to the advantage of the shoe manufacturers.

Such a decree, of course, would not compel the United Company to lease additional machines to existing lessees or to new manufacturers hereafter entering business except on such new terms as to payment as the United Company should determine it necessary to charge. It would therefore not give shoe manufacturers in the future the benefit of the present conditions.

But furthermore as applied to present leases this proposal is absolutely without justification. The clauses in question go to the very root of the leases. If they were held illegal and their enforcement enjoined, there would be no contract left between the parties, and the leases would necessarily be illegal and unenforceable by either party, or at least could be cancelled by either party at any time.

For example, take the seventeen-year term. If the United Company were enjoined from enforcing this clause, it would mean that the United Company could not compel a lessee to retain his machines for the period of seventeen years, but that the lessee could return them at any time. But if the United Company were so enjoined, it must be because the clause is illegal. If so, it clearly follows that the lessee could not enforce the clause. In other words, there would be no term for the lease, and the lessee could return the machines, or the United Company could withdraw them at any time. The lease could be cancelled by the United Company at once and the United Company would certainly be obliged to make such cancellation. In other words, it is impossible to enjoin the United Company from enforcing this seventeen-year clause without cancelling the leases or making them terminable at the option of either party.

Take the Full Capacity Clause. Machines held under leases containing this clause were leased on an understanding that they should be used as contemplated in the Full Capacity Clause. If they are not so used, the United Company may get no return for its machines, as its royalty is dependent on the use of the machines. This clause goes to the very essence of the contract. If it were held illegal, the whole lease must

be illegal, and therefore the lessee would no longer have any right to retain the machines without the permission of the United Company. To hold otherwise would be to hold that the Court can decree that machines owned by the United Company shall be held by a shoe manufacturer on terms not contemplated or agreed to by either party. In other words, it would be to hold that the Court by its decree can create a new contract between the parties which would be totally unfair to one of them and in some instances might deprive it of practically its entire return on its investment.

Take the clause contained in some of the Goodyear leases requiring the lessee to pay a royalty for the use of the machines based upon the total factory output of the lessee. This is the only clause in the lease requiring the lessee to pay any royalty to the United Company (except a small minimum payment). This clause goes to the very essence of the contract. If the United Company were enjoined from enforcing it, it could not obtain any compensation for its machines whatsoever. To enjoin the United Company from enforcing it and at the same time to hold that the lessee may continue to retain and use the machines would be to confiscate the United Company's machines.

Take the Auxiliary Restricted Use Clause. The United Company has thousands of patented Goodyear auxiliary machines on lease. No royalty is charged directly for the use of these machines but they are restricted to use with the Goodyear Welter and Stitcher. The United Company receives its return for the entire group of machines from the royalties paid for the Welter and Stitcher.

Is it possible that the Court could enjoin the United Company from enforcing the restrictions placed on the use of these Goodyear auxiliaries and at the same time hold that the lessee had a right to continue to retain the machines under his lease and use them in connection with any machines he pleased? If so, it would mean that the Court would confiscate millions of dollars worth of machines owned by the United Company, for the result would be that lessees could continue to hold and use thousands of machines without making any royalty payment direct or indirect to the United Company for their use, excepting in some cases a nominal rental.

These auxiliary machines are patented machines. The only license the lessee has to use them is the restricted license contained in the leases authorizing their use on certain shoes. If, as the United States contends, this license is unlawful, then it necessarily follows that the lessee has no license at all to use the machines. If a patent suit is brought against him by the United Company for an infringement by the use of the machines, the lessee can defend only by setting up a license and of course it cannot set up an unlawful license. Therefore, if the restricted license were held unlawful, it clearly follows that the lessee would have no license to use the machines at all. To hold the only license which has been granted unlawful and at the same time to decree that the lessee has a right to use the machines as he pleases would be to create by decree of this Court a patent license which the United Company has never granted.

In the case of leases of machines containing the Restricted Use Clause, restricting their use to use in connection with machines of other departments, the same situation obtains. Such machines are leased at a reduced rate on the agreement that they are to be used as part of a series. To permit the lessee to use them otherwise would be to force a contract upon the United Company which it never entered into. Furthermore, the only license to use these patented machines is the restricted license contained in the leases which would be held unlawful. Lessees could not be authorized to continue their use unless a new license were granted them by the United Company.

The contention of counsel for the United States that the enforcement of these clauses can be enjoined and at the same time the lessees can be authorized to retain and use their machines for the term of the leases without complying with these provisions is, we submit, without justification.

In *Darius Cole Transportation Co.* v. *White Star Line*, 186 Fed. 63, a steamer was leased for three years at a specified rental, to be used on certain routes including a route between Toledo and Detroit. The lessor agreed to surrender to the lessee all of the good-will of the "river business," so-called, and agreed not to enter into competition with the lessee upon the routes named in the lease. It was held under the circum-

stances of the case that the lease resulted in giving the lessee a monopoly of the business between Detroit and Toledo, which constituted interstate commerce, and that it was, therefore, void because in violation of the Sherman Act. It was urged by the lessor that the agreement in relation to the interstate route between Detroit and Toledo be held void and the remainder of the lease be held valid and enforceable. The Court said (p. 68),—

> "The only use which respondent had of the Idlewild was under the contract, and that being void, and no basis existing for an apportionment of earnings under the interstate route from those earned wholly within the state, and thus no means of separating the legal from the illegal provision, it follows that no recovery can be had."

In *Dennehy* v. *M'Nulta*, 86 Fed. 825, a distilling company delivered to purchasers of its goods vouchers by which it agreed to pay a rebate on such purchases on condition that the vendee bought of it all his goods of a certain kind for a specified period. The condition was held illegal. The holders of the vouchers sought to recover the amount of the rebates provided for thereunder, although the conditions had not been complied with, on the ground that such conditions were unlawful. The Court said (p. 828):—

> "But assuming, for the argument, that both premises are well taken, no relief can then be granted for enforcement of the contract, as no consideration is left to support the promise. The condition is the sole consideration for the promise, and, if that is illegal, the promise falls with it. Even if the consideration were invalid only in part, the same result would follow, the promise being indivisible. Bish. Cont. §§74, 487; 3 Am. & Eng. Enc. Law, 886; Greenh. Pub. Pol. rule 24. No element of the contract as actually made between the parties remains to be enforced. *A court of equity cannot make a new contract for them, nor can it destroy the substance of the one which they have entered into, and at the same time preserve the contract obligation.* Recovery upon the vouchers in question, with the conditions unfulfilled, would have that effect, and must be denied in equity as well as in law" (italics ours).

In *Bishop* v. *Palmer*, 146 Mass. 469, the defendants purchased a certain business and property together with the goodwill for a consideration to be paid in instalments and the plaintiff agreed not to compete. The agreement not to compete was held invalid. The plaintiff sued the defendant for failure to pay the instalments due. The Court held that, since a portion of the consideration given by the plaintiff, namely, his contract not to compete, was unlawful, he could not compel the defendants to fulfil their agreement to pay for the property purchased. The Court said (p. 475):—

> "If they [the defendants] pay to the plaintiff the whole sum called for by the terms of the contract, it may well be that they can call on him to perform all of his agreements except such as are unlawful. In such case, they would merely waive or forego a part of what they were to receive, and recover or enforce the rest. It does not, however, follow from this that they can be compelled to pay the sum promised by them, when a part of the consideration of such promise was illegal. They are at liberty to repudiate the contract on this ground; and, having done so, the present action founded on the contract cannot be maintained; . . ."

4. The Leases cannot be Declared Unlawful or the United Company Enjoined from Enforcing them, as the Lessees are not Parties to the Suit.

We have shown above that the United Company cannot be enjoined from enforcing these leases without declaring the leases void, or at least without permitting the United Company to cancel the leases which it would necessarily be obliged to do. The lessees, therefore, are as vitally interested in the question of whether these leases are held valid as is the United Company itself. They now hold a valuable equipment of machines which have cost them no capital expenditure and for the use of which they pay very low royalties. They are entitled to hold these machines for long terms at the rates provided for in the lease and license agreements. If the leases were held void, in order to retain these machines they would be obliged to pay such prices as the United Company

might determine to exact from them. If the United Company chose, it could exact such terms as would make it impossible for many of them to continue in business, and, as we have shown, it would necessarily be required to charge prices which would seriously injure hundreds of small manufacturers.

Under these circumstances, in accordance with decisions of this Court, the lessees are necessary parties to a suit which seeks to declare these leases void or which seeks to declare provisions in the leases illegal which if held illegal would necessarily make the leases void or subject to cancellation by either party.

Minnesota v. *Northern Securities Co.*, 184 U. S. 199.
Gregory v. *Stetson*, 133 U. S. 579.
Shields v. *Barrow*, 17 How. 130.

In *Minnesota* v. *Northern Securities Co.* (*supra*) the State of Minnesota charged that a majority of the stockholders of the Northern Pacific and Great Northern Railroads had combined and transferred their stock to the Northern Securities Co. in order that the Northern Securities Co. might exercise a joint control over these two roads in violation of the laws of the State. It asked that the Northern Securities Co. be enjoined from voting its stock in the two roads or exercising control over them. This Court held that the Northern Pacific and Great Northern Railway Companies or their minority stockholders whom they represented were interested in the suit and were, therefore, necessary parties. It dismissed the bill on this ground. The Court said (p. 235):—

> "The general rule in equity is that all persons materially interested, either legally or beneficially, in the subject-matter of a suit, are to be made parties to it, so that there may be a complete decree, which shall bind them all. By this means the court is enabled to make a complete decree between the parties, to prevent future litigation, by taking away the necessity of a multiplicity of suits, and to make it perfectly certain that no injustice is done, either to the parties before it, or to others who are interested in the subject-matter, by a decree which might otherwise be granted upon a partial view only of the real merits. When all the parties are before the court, the whole case may be seen; but it may not, where all the conflicting

interests are not brought out upon the pleadings by the original parties thereto (Story's Eq. Plds. sec. 72).

"The established practice of courts of equity to dismiss the plaintiff's bill if it appears that to grant the relief prayed for would injuriously affect persons materially interested in the subject-matter who are not made parties to the suit, is founded upon clear reasons, and may be enforced by the court, *sua sponte*, though not raised by the pleadings or suggested by the counsel. *Shields* v. *Barrow*, 17 How. 130. *Hipp* v. *Babin*, 19 How. 271, 278; *Parker* v. *Winnipiseogee Lake Cotton and Woolen Co.*, 2 Black, 545."

If the Northern Pacific and Great Northern Railway Companies are necessary parties in a suit to enjoin another corporation holding stock in them from voting its stock or exercising control over them, it would seem clear that a lessee in the present case having a valuable set of machines under lease on very favorable terms is a necessary party to a suit to hold such lease invalid.

The United States contends that this suit is not like a private suit involving only private rights, but *Minnesota* v. *Northern Securities Co.* equally involved public rights. The United States also relies upon *United States* v. *du Pont de Nemours & Co.*, 188 Fed. 127, in which it was held that a trustee for bondholders of the company was not a necessary party to a suit for dissolution under the Sherman Act. But as the Court pointed out in that case, it was not dealing with titles to property. The obligations of the Company to its bondholders were not to be affected nor the bondholders deprived of their bonds nor of the security therefor. In the present case it is sought to hold the leases void and thereby deprive the lessees of their rights in the leased machines, thus directly affecting their property rights, and their contracts of lease.

If it is impractical to make all the lessees parties, at least certain of the lessees should be made parties as representatives of the class.

XII.

CONCLUSION.

We submit:—

1. That the United States has wholly failed to prove any part of the charge made in the petition, namely, that the defendants, finding that the patents of the constituent companies under which they did the greater part of the business of the country in the principal essential shoe machines were about to expire, planned to extend their patent monopolies unlawfully by—

(*A*) Combining and acquiring all concerns engaged in the shoe machinery business, and then

(*B*) Refusing to sell or lease any of said so-called essential machines to a shoe manufacturer except on condition that he take from them practically all other machinery which he required, and that

(*C*) They thereby acquired an unlawful monopoly of all shoe machinery.

There is no evidence of any such plan, and the record shows conclusively that the defendants never did anything to carry out such a plan, for, as the District Court found:—

(*A*) They did not acquire all concerns engaged in the shoe machinery business or attempt so to do.

(*B*) They did not refuse to lease the alleged essential machines except on condition that the shoe manufacturer take all other machines required by him from them. As the District Court found, this charge was wholly unfounded.

(*C*) They did not acquire an unlawful monopoly of all shoe machinery, as the United States itself conceded during the course of the trial.

2. The United States attempted during the course of the trial to limit its charge to a charge that the defendants planned to extend their patent monopolies unlawfully by—

(*A*) Combining and acquiring all concerns engaged in the business of manufacturing machines for preparing and attaching the bottoms to the uppers of shoes, eyeletting machines and clicking machines, and

(*B*) Refusing to sell or lease any of the so-called essential machines to a shoe manufacturer except on condition that he take from them practically all other machines of the above named classes, and that

(*C*) The defendants carried out such plan and thereby acquired an unlawful monopoly of said classes of machinery.

There is equally no evidence of any such modified plan or of any monopoly obtained in pursuance of any such modified plan, for, as the District Court found,—

(*A*) The defendants did not acquire or attempt to acquire all concerns engaged in manufacturing shoe machinery of the above mentioned classes. On the contrary they expressly declined to purchase their largest competitors making such machines.

(*B*) They did not refuse to lease the so-called essential machines except on condition that the shoe manufacturer take all other machines from them. On the contrary the record shows that the United Company never required a shoe manufacturer leasing its so-called essential machines to take or use any other machines, and that the only clause employed in its leases at the time the petition was filed requiring any use whatsoever of its machines was the Full Capacity Clause which required only a use of the particular machines leased. It further shows that the United Company's so-called restricted leases not only did not require the lessee to agree to use other machines, but that they did not compel such a use in order to obtain the leased machines, since the lessee was offered alternative forms of leases without restrictions on terms as favorable, and in many cases more favorable than were offered him prior to the formation of the United Company.

(*C*) The defendants did not have an unlawful monopoly of machines of the above-mentioned classes. On the contrary not only were there a number of competitors, but the business the defendants had in such machines was due to the fact that the United Company and its constituent companies had created such business by reason of their patented inventions, that their machines had always been the best in the market, and their success was due to the excellence of the machines, the constant improvements made in them, the remarkable service rendered with them and the favorable terms offered lessees.

3. We further submit that the record utterly fails to justify any other charge of unlawful conduct or monopoly, even if such a charge had been made in the petition and it were therefore open to the United States.

The history of the development of the United Company and of its constituent companies is a remarkable history of the creation of a new industry. By constant efforts and intelligent experimentation conducted at great expense, it has produced what are unquestionably the best machines, and these machines are lawfully protected by patents so that others cannot manufacture them. Most of these machines when first put on the market were new creations doing work previously done by hand. Nearly all of the United Company's machines to-day are new machines or new models so improved as to constitute practically new machines, or are machines invented within a few years to do work previously done by hand. The United Company's success in furnishing these machines is as natural and lawful as was the success of the Bell Telephone Company as owner of the Bell patent in the telephone field.

In addition the United Company is furnishing its machines under a lease system whereby the lessee can obtain his machines with practically no initial cost, paying for them only as he has use for them, and under which he is permitted to share in the economies resulting from the combined use of the principal machines which are adapted for use together, and

the United Company furnishes at great expense to itself and without charge to its lessees a service with its machines which shoe manufacturers testified was vital to the proper conduct of their business.

During a period in which the cost of nearly all supplies and machinery has increased, the United Company has never increased its prices, but on the contrary has in numerous instances reduced them, and, in addition, for such prices it has furnished, not the machines put out in 1899, but greatly improved machines, and many additional auxiliary machines which save the shoe manufacturer more than the entire amount paid the United Company in royalties.

As the District Court found:—

> "That the degree of success attained and the preponderance in number of users supplied which the United Company has secured are fully accounted for by the superior efficiency it has developed in its patented machines for work in combination with each other, together with the superior facilities it affords as above for their most efficient use, must be regarded as shown beyond question. It is not disputed that, when the petition was filed, its machines represented, in number and amount, the highest development ever reached in the art to which they belong; or that they are most in demand by manufacturers of the higher grades of shoes for that reason" (R. Vol. 1, p. 1137).

The attempt of the United States to prove that the success of the United Company was not due to the above causes but to various unlawful means adopted in pursuance of a plan to monopolize failed utterly. The charges of the United States were made recklessly and without investigation. The petition is replete with allegations made without any foundation of fact whatsoever on which even to base a contention. Thus, for example, the allegation that the United Company discontinued the sale of machines; the allegation that the patents of the constituent companies were about to expire; the allegation that the leases required the lessee to covenant to use United Company's machines of the kind leased and all other kinds exclusively; the allegation that the United Company acquired various patents and held them without making any use of them, thus depriving the manufacturer and the

public of the benefits arising therefrom; the allegation that exorbitant prices were charged for repair parts; and the allegation that the constituent companies were taken over for values far in excess of real worth, and numerous other allegations, were shown to have no foundation whatsoever, although the true facts would have been disclosed upon the slightest investigation. The specifications of the United States with respect to the unfair acts alleged by it were shown to be equally unfounded. As to the majority of them, no evidence whatsoever was introduced, and as to the remainder the evidence showed an utter lack of foundation for the charges.

The District Court heard the witnesses in open court and thoroughly investigated the entire business history of the United Company. The facts on which its opinions are based are fully sustained by the record, and completely dispose of the contentions of the United States.

We respectfully submit that the decree of the District Court dismissing the bill should be affirmed.

Respectfully submitted,

FREDERICK P. FISH
CHARLES F. CHOATE, JR.
MALCOLM DONALD
of Counsel for Appellees

THE "ACQUISITIONS."

Detailed Statements of the Facts.

(NOTE.—The companies are discussed in the same order as in the petition except the Boot & Shoe Sole Laying Company, a majority of the stock of which was acquired by the United Company in June, 1899, while the date of the acquisition stated in the petition is May 25, 1901; and except The T. A. Norris Machine Company, which was acquired July 1, 1902, not in March, 1903, as stated in the petition. The statements as to those companies will be found in their proper places in chronological order. The purchase of Plant's patents and inventions is not discussed here as the facts regarding that transaction have been set forth in our brief, *supra*, pp. 507–586.)

Goddu Sons Metal Fastening Company.

This transaction took place March 1, 1899 (P.'s Ex. 60, R. Vol. 3, p. 514). The Goddu Sons Metal Fastening Company "had constructed a loose nailing machine, a slugging machine, a tacking machine, and a standard screw machine." Each of these machines was "in a state of development" and none of them was "in a condition to be placed in the hands of manufacturers for continuous operation" (Howard, R. Vol. 1, p. 41, lines 38–40; Winslow, R. Vol. 1, p. 436, lines 28–31). The Goddu Sons Company had no machines whatever in the hands of customers and accordingly was not engaged in interstate or foreign trade or commerce. These four machines, which were all patented, were all metallic fastening machines. The Goddu Sons Company had no factory and the experimental work had been done in a small machine shop with a few tools in it adjoining the house of Louis Goddu, the father of the "Goddu Sons" (R. Vol. 1, p. 103, lines 35–45; p. 104, lines 1–7; p. 436, lines 2–3, 27–28, 34–36).

Louis Goddu had been for a long time employed by the McKay Shoe Machinery Company and its predecessors, and his inventive work "had been very meritorious. It was the base of the McKay metallic machinery business" (Winslow, R. Vol. 1, p. 436, lines 15–19; Defs.' Ex. 101, R. Vol. 5, pp. 166, 168). All of his sons had also been employed by the McKay Company and several years prior to the organization of the United Company had all left the employ of the McKay Company (R. Vol. 1, p. 104, lines 8–10, 12–13).

The negotiations for this transaction were opened by the Goddus.

> "Mr. Goddu, senior, came to me and wanted the transfer, . . . to have the United Company take this property, . . . wanted to relieve himself of the position that he was in" (Winslow, R. Vol. 1, p. 436, lines 4, 5, 10).

Both Goddu, senior, and Van Wagenen had talked to Mr. Winslow about the situation before the United Company was organized (R. Vol. 1, p. 436, lines 20–23).

The United Company did not acquire anything whatever from the Goddu Sons Company. It acquired from Louis Goddu and his sons a majority of the stock of the Goddu Sons Company and a number of patents and applications for patents (R. Vol. 1, p. 41, lines 31–34; p. 534, lines 27–28). There were two reasons for this acquisition:

(1) It was claimed by officials of the McKay Shoe Machinery Company "that the inventions embodied in the machines of the Goddu Sons Company had been made by Louis Goddu, the father," who had agreed to assign his inventions to the McKay Metallic Fastening Association, a predecessor of the McKay Company, by his employment contracts which were still in force and under which he had been paid continuously, and was still being paid, for his exclusive services. Suit had been brought on those contracts "to compel the transfer of these inventions" which were in the Goddu Company's machines to the McKay Company (Winslow, R. Vol. 1, p. 436, lines 42–44; Howard, R. Vol. 2, p. 2071, Ints. 1578, 1579; Defs.' Ex. 104, R. Vol. 5, pp. 245–252).

The bill of complaint in that suit, which is Defendants' Exhibit 104 (R. Vol. 5, p. 243), reviewed the history of Louis Goddu's relations with the McKay Company, including his declaration that he would assign no more inventions (pp. 245–252), set forth that none of the sons had made any inventions while in the employ of the McKay Company (p. 253) and charged that Louis Goddu, his sons and Albert Van Wagenen, also formerly employed by the McKay Company, conspired to have Louis Goddu invent metallic machines, communicate such inventions to his sons and permit them to apply for patents upon the machines and transfer such patents to the Goddu Company (pp. 253–262).

Counsel of the highest standing, Mr. Louis D. Brandeis, appeared for the McKay Company in this suit (R. Vol. 5, p. 264).

The endless trouble which the McKay Company had had with Louis Goddu and threats that he had made are further set forth in the affidavit of James W. Brooks (Defs.' Ex. 101, R. Vol. 5, p. 161), prepared for use in the proposed infringement suits. Among illuminating facts developed by the evidence in the pending suit which are recited in this affidavit,

it appears that Louis Goddu, the father, had contributed $40,000 to the Goddu Sons' enterprise (p. 187) and that he had been working with his sons continuously for several years (pp. 183, 184).

Mr. Winslow testified,—

> "I knew Mr. Goddu, senior, quite well and believed personally that the patents then standing in his and his sons' names, and those that had been transferred to the Goddu Company, belonged in reality to the McKay Company" (R. Vol. 1, p. 435, lines 43–45; p. 436, lines 1–2; Defs.' Ex. 231, R. Vol. 5, p. 447).

That is, by this acquisition Mr. Winslow was securing control for the United Company of inventions and patents and applications for patents which he believed already belonged to the United Company, as successor of the McKay Company.

(2) There was very serious litigation existing and threatened between the parties. The pending suit which had been brought on the Louis Goddu contracts had been running for some time before the formation of the United Company, had been "very vigorously contested" and "a very large amount" of testimony had been taken, and the claims of the McKay Company had been developed and substantiated before the acquisition (R. Vol. 1, p. 104, lines 14–24; R. Vol. 2, p. 2082, Cr. Ints. 1618–1620; Defs.' Ex. 275, R. Vol. 5, p. 755).

In addition to this pending suit the McKay Company had—

> "caused to be prepared bills of complaint and affidavits to accompany motions for preliminary injunctions in suits for infringements of its patents by all of the machines of the Goddu Sons Metal Fastening Company" (Howard, R. Vol. 2, pp. 2077, 2078, Ints. 1609–1611; Defs.' Ex. 275, R. Vol. 5, p. 755).

A number of affidavits, including one by Joseph P. Livermore, and a bill of complaint had been printed prior to the formation of the United Company and printed copies constitute Defendants' Exhibit 101 (R. Vol. 5, p. 140). According to Mr. Livermore's affidavit, the Goddu Sons' loose nailer infringed six of the McKay Company's patents; its screw machine infringed two of the McKay Company's patents; its slugging machine infringed two of the McKay Company's patents.

and its string nailer infringed three of the McKay Company's patents (Defs.' Ex. 275, R. Vol. 5, p. 756).

Mr. Winslow testified:—

> "I very much desired to start the United Company free from all serious litigation. I was aware of the fact that there was serious litigation existing between the McKay Company and the Goddus."
>
> "I was very glad to get rid of the situation which meant I didn't know how much litigation and how much time it would require from me, and to get that whole matter cleaned up and clear the litigation."
>
> "I had had considerable experience in that sort of litigation.
>
> "*Q.* Did you acquire the Goddu Sons Company for the sake of getting rid of any competition?
>
> "*A.* I did not" (R. Vol. 1, p. 435, lines 40–43; p. 436, lines 10–14; p. 437, lines 6–10).

The practical reasons why the Goddu machines could not be manufactured and put out without *entire reconstruction* were set forth by defendants' expert Howard with detailed explanations. In July, 1898, Mr. Howard spent a week in examining the Goddu Sons' machines, making drawings and notes (R. Vol. 2, p. 2070, Int. 1577; pp. 2088, 2089, Cr. Int. 1660; p. 2099, Cr. Int. 1666).

Moreover, even if the machines had been practical, "the United Company couldn't have developed those machines if they wanted to" because "they were stopped by the action of the minority stockholders of the Goddu Company" (Winslow, R. Vol. 1, p. 534, lines 20–26).

It should also be noted that after the acquisition all but one of the Goddu Company's machines infringed patents of the United Company acquired from the Goddu Sons individually, which did not expire until 1915 and 1917 (Defs.' Ex. 275, R. Vol. 5, pp. 756, 757).

As to this transaction it was held by the District Court:

> "the metallic fastening machines acquired by purchase of a controlling interest in the company were none of them in the hands of users; their then state of development does not appear to have been such as made them capable of commercial use, whatever the merit of the inventive ideas they sought to embody; nor is the evidence suffi-

cient for a belief that without reconstruction, radical in character, anyone could have used them as competing machines" (Dodge, J., R. Vol. 1, p. 1140).

Pearson & Bennion, Ltd.

This transaction took place June 8, 1899 (P.'s Ex. 61, R. Vol. 3, p. 525). The reason for this purchase and the disposition of the acquired business after the purchase were summarized by Mr. Winslow as follows (R. Vol. 1, p. 420, lines 21–33):

> "Our agent in England for the Lasting Machine Company was Pearson & Bennion. They made or manufactured no machines that were made or manufactured by either of the companies which came together to form the United Shoe Machinery Company. They did make a few general department machines in England. Their principal business, probably eighty per cent of it, was the business they did as the agent for our lasting machine. We took their business, put our business with it and formed the British United Company. They entered our employ, and Mr. Bennion was made the general manager of that business. That was the reason; it was just putting in corporate form what had previously existed, only he was made the manager of all the business of these three companies."

As stated by Mr. Winslow: "The agreement of 1899 with Pearson & Bennion was in reality a consolidation of the foreign business of the United Company in England with Pearson and Bennion's business, and not a purchase" (Defs.' Ex. 231, R. Vol. 5, p. 450). Among the assets acquired was a new factory (R. Vol. 3, p. 530).

From Mr. Winslow's testimony, above quoted, that the few machines which Pearson & Bennion made were of the general department type, it is clear that Pearson & Bennion were in no way competing with the United Company since the United Company had no general department machines at that time. While the record does not name the Pearson & Bennion machines, they were presumably of the types used by English manufacturers, somewhat different from those used in this country. They were being manufactured under

patents (R. Vol. 1, p. 53, lines 3–5; R. Vol. 2, pp. 2787, 2788, Cr. Ints. 432, 433; R. Vol. 3, p. 527).

Boot & Shoe Sole Laying Company.

This acquisition is not referred to in its proper chronological order in the petition. The date alleged, May 25, 1901, is the date of the bill of sale formally transferring the company's property (P.'s Ex. 90, R. Vol. 3, p. 366). A majority of the stock of this company was acquired by the United Company in June, 1899 (R. Vol. 1, p. 457, lines 30–31; Defs.' Ex. 275, R. Vol. 5, p. 763). Accordingly this acquisition will be discussed here in its proper chronological relation to other acquisitions.

The Boot & Shoe Sole Laying Company was manufacturing and putting out a patented sole laying machine known as the Boston sole layer. It was doing a very small business. It owned no real estate and contracted with outside parties for such machines as it had built (R. Vol. 1, p. 54, lines 5–7; p. 99, lines 41, 43–45, R. Vol. 2, p. 2054, Ints. 1489, 1490; Defs.' Ex. 231, R. Vol. 5, p. 450).

The United Company did not have a satisfactory sole laying machine. They "had an inferior machine of different type," the rotary sole layer, "which was only adapted for large factories" and "which was very unsatisfactory because it was continually breaking down, particularly on men's shoes" (R. Vol. 1, p. 54, lines 20–21; Defs.' Ex. 231, R. Vol. 5, p. 450, and 275, R. Vol. 5, p. 763).

A further reason for this acquisition was that the United Company had "produced and desired to use the pressing form for sole laying machines shown and described in its patent 694,367 Mar. 4, 1902, Gifford (application filed Apr. 20, 1900)," but this form infringed a patent owned by the Boot & Shoe Sole Laying Company (Howard, Defs.' Ex. 275, R. Vol. 5, p. 763; R. Vol. 1, p. 665, lines 1–3). After this acquisition—

> "the United Company discarded the Rotary Sole Layer and adopted as its standard commercial machine the sole layer of the Boot and Shoe Laying Machine Company, using on that machine the pressing form of Gifford patent

No. 694,367. This machine, combining the best features of the rotary machine and the machine of the Boot and Shoe Sole Laying Company, has been much improved by a number of inventions made from time to time, and in the various stages of its development it has ever since been and is today the standard sole laying machine of the United Company" (Howard, Defs.' Ex. 275, R. Vol. 5, p. 763; R. Vol. 2, p. 2050, Ints. 1467, 1468).

The Corrugated Wire Fastening Company.

This transaction took place June 30, 1899 (P.'s Ex. 62, R. Vol. 3, p. 530). With regard to the Corrugated Wire Fastening Company, Mr. Howard testified that at the time of the purchase it—

> "had one machine, a tacking machine, and was doing a very small business in supplying wire for that machine. I believe they had not put out any of the machines for some years because it was completely out of date. It was a very old machine" (Howard, R. Vol. 1, p. 42, lines 12–17).
>
> "The only business that was left when the Corrugated Company was acquired was the supplying of wire and spare parts for the machine. They had not done any business in the way of supplying machines for some time, and there was no longer any demand for the machines, so that no business was done and no business could be done with that machine" (Howard, R. Vol. 1, p. 42, lines 28–33).

This company "was purchased in 1899 for $12,750 at the earnest solicitation of the owners, their business having become unprofitable. At the price we paid we thought we could get out of it with a small profit" (Winslow, R. Vol. 1, p. 464, lines 20–23).

The Corrugated Wire Fastening Company—

> "Owned no real estate. Leased a small room on South Street, Boston, where it employed two or three men" (Winslow, Defs.' Ex. 231, R. Vol. 5, p. 475).

After the purchase—

> "The United Company continued to supply wire and parts for those machines. They have parts in stock today" (Howard, R. Vol. 1, p. 42, lines 33–35).

The business of the Corrugated Company was characterized by the District Court as "making wire and spare parts for use in an obsolete metallic-fastening machine" (Dodge, J., R. Vol. 1, p. 1138).

Breach Manufacturing Company.

This transaction took place July 31, 1899 (P.'s Ex. 63, R. Vol. 3, p. 531). All that the United Company acquired from the Breach Manufacturing Company was an exclusive license under certain patents on a machine—

> "which was intended for cutting soles out of a side or strip of leather by a reciprocating knife which moved up and down through the stock as it went around" (Howard, R. Vol. 1, p. 42, lines 44–45; p. 43, line 1; R. Vol. 2, p. 2067, Int. 1559).

At that time the United Company had no machine for cutting out soles (R. Vol. 1, p. 43, lines 13–16, 22–24). The machine which it puts out now for that purpose is a General Department machine (R. Vol. 2, p. 2645).

The United Company paid the Breach Company $10,000 for an exclusive license under the Breach patents in the hope that a successful machine to cut the uppers of shoes (*i.e.*, to do the work done by the clicking machine invented some eight years later) would be developed under those patents (Defs.' Ex. 231, R. Vol. 5, p. 467).

Mr. Howard testified:

> "The United Company took Breach into its employ and for several years made strenuous efforts to develop something practical out of that machine. Breach worked on the machine during that period and spent a great deal of money, but finally came to a point where he could apparently do nothing more, and at that stage the machine was an entire failure as a commercial machine" (R. Vol. 1, p. 43, lines 16–22).

Also—

> "The United Company built experimental machines and put them out on trial but could not interest manufacturers to use them" (R. Vol. 2, p. 2068, Int. 1562).

"Every possible assistance" was given to Breach by the United Company in the endeavor to make commercial the ideas embodied in his inventions, and that work was continued for some two years (R. Vol. 2, p. 2084, Cr. Ints. 1635, 1636).

> "In this endeavor the United Company expended about $30,000 and then gave up the attempt" (Winslow, Defs.' Ex. 231, R. Vol. 5, p. 467; Howard, R. Vol. 2, p. 2100, Int. 1668).

An important reason for the commercial failure of the Breach inventions was stated by Mr. Howard to be that—

> "Shortly before the time of the acquisition of the Breach patents, sole-rounding machines of the so-called Stanley and Julian type were introduced, which used a wooden pattern instead of a metal pattern such as had been previously used in sole-rounding machines, and as was used in the Breach machine. That pattern cost but a small fraction of the cost of the metal pattern, and was a very great improvement because it obviated the necessity of lubricating the edge of the pattern, which had always presented a serious difficulty" (R. Vol. 2, p. 2085, Cr. Int. 1641).

Mr. Howard also said "the United Company offered to turn back the patents to the Breach Company, and I believe it did so" (R. Vol. 1, p. 43, lines 9–10).

It should be noted that by this transaction the United Company acquired only an exclusive license under certain patents; it acquired no tangible property of any description (R. Vol. 3, p. 531).

Peter A. Coupal and William Gordon.

This transaction took place August 1, 1899 (P.'s Exs. 64–66, R. Vol. 3, pp. 535, 537, 538). Coupal and Gordon were running a machine shop and doing a general machine shop business, "not particularly relating to shoe machinery." They had one or two unimportant machines and an experimental "Basting Machine" which infringed a patent of the United Company (Howard, R. Vol. 1, p. 43, lines 27–35; p. 103, lines 25–26; Defs.' Ex. 275, R. Vol. 5, p. 757).

> "The United Company was not engaged in putting out or manufacturing such machines as Coupal and Gordon were making and putting out, or machines for performing the same or similar work" (Howard, R. Vol. 1, p. 43, lines 36–39).

The United Company acquired certain patents from Coupal and Gordon, but this transaction was primarily an employment contract. Coupal and Gordon were both "very skilled mechanics" and "were in the employ of the Goodyear Company prior to, and at the time of, the organization of the United Company and the United Company desired to obtain all their time free from outside matters." Gordon agreed to enter the employ of the company in a managerial capacity and remained in the company's service until his death in 1912. Coupal agreed to enter the employ of the company, but "only remained in the company's service a few months" (R. Vol. 1, p. 103, lines 22–24, 28–29; P.'s Exs. 64, 65, R. Vol. 3, pp. 535, 537; Defs.' Ex. 231, R. Vol. 5, p. 472).

The size of their business and relative importance of their machines is indicated by the consideration of this transaction, which was $10,799.25,—the value of their inventory quoted in Plaintiff's Exhibit 66, pp. 539–563. No real estate was acquired (Defs.' Ex. 231, R. Vol. 5, p. 472).

> "Soon after the purchase the machinery was removed to one of the United Company's factories and the business was continued in conjunction with the other business of the company" (Winslow, Defs.' Ex. 231, R. Vol. 5, p. 472).

Timothy A. Bresnahan; Boston Shoe Tool Company.

This transaction took place August 16, 1899 (P.'s Ex. 67, R. Vol. 3, p. 563). The Boston Shoe Tool Company, which was Bresnahan's Company,—

> "was manufacturing and selling a patented edge trimming machine and a rotary edge setter, and was also making and selling forepart and shank cutters for use on the edge trimming machine, and edge setting irons for use on the rotary edge setter. The rotary edge setter was adapted only for the cheapest kind of work and never used on any

other work. It could not be used with profit on any other kind of work. . . . Every edge trimming machine has a forepart cutter for trimming the sole around the forepart and a shank cutter for trimming the sole in the shank. . . . The finish or shine that the edge has when the shoe is new is given to it by the edge setting operation, and the tool which operates upon the shoe in this operation is known as an edge setting iron. . . . At the time of this acquisition the United Company had no machines for doing the work of either of the two machines acquired from the Boston Shoe Tool Company and it was not manufacturing any edge cutters or any edge setting irons" (Howard, R. Vol. 1, p. 43, lines 40–45; p. 44, lines 1–23).

The United Company acquired the Boston Shoe Tool Company's factory and the patents on its cutter and its edge trimming machine (R. Vol. 1, p. 103, lines 19–21; Defs.' Ex. 231, R. Vol. 5, p. 460).

"The business was continued at the same plant for a considerable period of time. Subsequently, for convenience and economy of manufacture, the business was transferred to the Beverly Factory, where the United Company has ever since continued and increased the business" (Winslow, Defs.' Ex. 231, R. Vol. 5, p. 460).

Edge trimming and edge setting machines, the only two machines acquired from this concern, are General Department machines and are sold outright (R. Vol. 1, p. 12, line 37 *et seq.;* Vol. 5, pp. 425, 428, 429).

In regard to the covenant quoted in the petition (R. Vol. 1, p. 1003) Mr. Howe testified as to the reasons why the covenant was in this particular form (R. Vol. 1, p. 692, lines 34–44; p. 693, lines 1–6).

Edwin T. Freeman.

This transaction took place October 9, 1899 (P.'s Ex. 68, R. Vol. 3, p. 569). Edwin T. Freeman had constructed an experimental slugging machine (R. Vol. 1, p. 44, lines 24–29; Defs.' Ex. 275, R. Vol. 5, p. 757); operation explained (R. Vol. 2, p. 2464) which was patented (R. Vol. 1, p. 103, lines 15–18). He had no factory and was doing no business. He "had not put out any machines at all" (R. Vol. 1, p. 849, line 15;

Defs.' Ex. 231, R. Vol. 5, p. 467); accordingly he was not engaged in interstate or foreign trade or commerce.

At the time of this acquisition the United Company was developing an improved standard screw machine, which later became Screw Machine, Model B—Rapid Standard, which infringed one of Freeman's patents. There was an interference in the Patent Office between an application for reissue of that Freeman patent and the application on this standard screw machine which the United Company was developing (Defs.' Ex. 275, R. Vol. 5, p. 758).

On the other hand, the Freeman machine infringed one of the United Company's patents and after January 21, 1902, would have infringed another patent granted on that date. These infringements could not have been avoided without entirely reconstructing the Freeman machine to omit from it valuable inventions, on account of which the United Company purchased the Freeman patents. Furthermore, an important mechanism, without which Freeman's machine could not have been a commercial success, had been necessarily omitted from the Freeman machine because it was broadly covered by two of the United Company's patents (Defs.' Ex. 275, R. Vol. 5, pp. 757, 758).

This acquisition cleared up these serious patent complications and enabled the United Company to improve its slugging machine and to avoid infringement of the Freeman patents (Defs.' Ex. 231, R. Vol. 5, p. 467).

Since the purchase, inventions claimed in the patents assigned by Freeman have been embodied in three different types of machines which the United Company has built and put out; namely, Nailing Machine, No. 2 Loose; Slugging Machine, No. 5; Screw Machine—Model B, Rapid Standard (R. Vol. 2, pp. 2066, 2067, Ints. 1554, 1557; pp. 2090, 2091, Int. 1662).

George W. Freeman.

This transaction took place October 10, 1899 (P.'s Ex. 69, R. Vol. 3, p. 573). George W. Freeman is the son of Edwin T. Freeman, from whom certain patents were purchased in 1899, as above explained. "Nothing was acquired by the

United Company from George W. Freeman" (R. Vol. 1, p. 44, lines 42–43). Consequently the statement in the petition (R. Vol. 1, p. 1003) that the United Company acquired the interests of George W. Freeman relating to shoe machinery is absolutely erroneous. He had been engaged with his father in work upon his father's experimental machine and the acquisition of his father's patents left him without a job.

> "As this transaction left the son, George W., without a job, his father asked the company to take the son into its employ for at least one year at a compensation of $800."
>
> "Freeman has remained continuously in the employ of the company as a roadman and now receives $1200 per year. He has never made or assigned any inventions to the company" (Winslow, Defs.' Ex. 231, R. Vol. 5, p. 472).

Mr. Winslow explained this employment contract as follows:

> "It was undoubtedly in view of the fact that he had been associated with his father in experimental work, and on account of the possibility of his setting up some claim to the inventions assigned by his father, that the covenants in regard to competition and future inventions were made a part of the contract for employment of George W. Freeman" (Defs.' Ex. 231, R. Vol. 5, pp. 472, 473).

Mr. Winslow's explanation is supplemented by Mr. Howard's testimony:—

> "The agreement was made with him at that time simply because he was his father's son and had been engaged with his father in work upon his father's machine. It not infrequently happens that a son may be responsible for some of the inventing in a case like that. It was a matter of precaution" (R. Vol. 1, p. 44, line 45; p. 45, lines 1–4).

Albert G. Brewer.

This transaction took place October 11, 1899 (P.'s Ex. 70, R. Vol. 3, p. 575). Brewer had built one experimental heel breasting machine of the automatic type, which was covered

by a pending patent application. A heel breasting machine is used to trim the front end of a heel. At that time the United Company was not putting out any heel breasting machine but was experimenting on a machine in which the knife was driven through the heel by power (R. Vol. 1, p. 45, lines 7–29; p. 103, lines 12–14).

> "Prior to February, 1899, all heel breasting was done by foot power machines . . . all the power required for forcing the knife through the successive layers of stock in the heel being applied by the operator through the treadle" (Howard, R. Vol. 2, pp. 2472, 2473).

Owing to the fact that "all heels vary in height, even the heels of shoes which are intended to be substantially alike," no power operated machine had yet been produced—

> "which could deal successfully with the problem of cutting just far enough to sever completely the surplus stock and, at the same time, not cut far enough to deface the shank of the sole" (Howard, R. Vol. 2, p. 2473).

Mr. Howard further testified (R. Vol. 1, p. 45, lines 34–37):

> "The Brewer patent covered a better, a more sensitive, mechanism than we had for stopping the knife properly when it reached the shank, to prevent cutting into and possibly cutting through the shank."

The United Company's experimental machine did not become a commercial success until "after the invention which we acquired from Brewer had been embodied in our machine" (Howard, R. Vol. 1, p. 45, lines 14–16).

On the other hand, the Brewer experimental machine infringed fourteen claims of the United Company's broad Heys patent on mechanism for automatically stopping the knife (R. Vol. 1, p. 45, lines 27–28; Defs.' Ex. 275, R. Vol. 5, p. 758). As stated by Mr. Howard: "in my opinion Brewer could not have built a power heel-breasting machine without infringing that patent" (Defs.' Ex. 275, R. Vol. 5, p. 758). After the purchase "approximately 700" machines incorporating the Brewer inventions were put out by the United Company (R. Vol. 2, p. 2066), and "That machine, with some modifications, is still being manufactured and put out by the United

Company" (Howard, R. Vol. 2, p. 2065, Int. 1548; p. 2090, Int. 1662). It is a General Department machine and is sold outright (R. Vol. 1, p. 12, line 37 *et seq.;* Vol. 5, p. 425).

The one experimental machine which Brewer had constructed was turned over by him to the United Company with his patent application (P.'s Ex. 70, R. Vol. 3, p. 576). It follows, therefore, that Brewer was not engaged in interstate or foreign trade or commerce. No manufacturing plant of any kind was acquired (Defs.' Ex. 231, R. Vol. 5, p. 467).

Globe Shoe Tool Company.

This transaction took place October 24, 1899 (P.'s Exs. 71–73, R. Vol. 3, pp. 577, 580, 583). The Globe Shoe Tool Company was a co-partnership, H. M. Loomer being one of the partners. It was engaged in the business of manufacturing and selling forepart cutters and edge irons, which are tools, not machines. It was acquired at the earnest solicitation of the partners and because the United Company desired to obtain the services of Mr. Loomer as the head of its department for manufacturing such tools (Winslow, Defs.' Ex. 231, R. Vol. 5, p. 460).

The agreement between Loomer and the United Company (P.'s Ex. 72, R. Vol. 3, p. 581) provides for the employment of Loomer by the United Company and recites that that had been agreed upon "as an inducement to the United Company to take over said business and to purchase the property and assets of said partnership."

On the other hand, the Globe Shoe Tool Company was infringing two patents of the United Company (Defs.' Ex. 275, R. Vol. 5, p. 759).

The Globe Company owned no real estate but leased floor space:—

> "Soon after its acquisition the business was transferred to the factory of the Boston Shoe Tool Company in South Boston" (Winslow, Defs.' Ex. 231, R. Vol. 5, p. 460).

After the Boston Shoe Tool Company and the Globe Shoe Tool Company acquisitions, very large reductions were made in the prices of the tools acquired, as follows:—

"The price of the heel cutter with blades in January, 1899, was $3.25; we reduced the price on March 1, 1900, to $2.25. In January, 1899, the price of the blades alone was $2; on March 1, 1900, we reduced the price for the blades alone to $1. The price of forepart and shank cutters in January, 1899, was thirty-five cents each, in small quantities, and twenty-five cents each in quantities of 100; on March 1, 1900, we reduced the price to twenty-five cents each in any quantity. The price of edge irons in January, 1899, was fifty cents; on March 1, 1900, we reduced the price to twenty-five cents" (Winslow, R. Vol. 1, p. 479, lines 10–19).

John Ritchie Company and John Ritchie.

This transaction took place November 2, 1899. "The John Ritchie Company was a concern manufacturing shoes," located at Quebec, Canada (R. Vol. 1, p. 46, lines 19–20; P.'s Ex. 74, R. Vol. 3, p. 585). This transaction was explained by Mr. Howard as follows:—

"They had manufactured, prior to the date in question, one old standard screw machine, so called, that being the type of machine which preceded the rapid standard screw machine, the greatly improved machine then in use for that kind of work. I think that machine was not being used by the John Ritchie Company, but had been sold by them. They had not built, and so far as I know did not contemplate building, any more machines, but they were making wire for use on standard screw machines. They were selling that wire to lessees of the United Company, who were obligated by their leases to buy wire from the United Company.

"It has sometimes happened that the United Company will find that a dishonest lessee, who has agreed to buy wire from the United Company, in payment of royalty for the use of a metallic machine, or, to be more specific, a standard screw machine, will buy wire from another concern at a lower price and use it on the United Company's standard screw machine. That was exactly what was happening in Canada. The John Ritchie Company were making and selling standard screw wire to lessees of the United Company, which, of course, was not getting any return whatever for the use of its machines during the period that the Ritchie wire was being used in them. The

purpose of this transaction was to eliminate that dishonest situation in Canada" (R. Vol. 1, p. 46, lines 20–42).

Mr. Winslow stated that—

> "The reason for this contract and purchase was to prevent manufacturers who held Metallic Machinery under lease from the United Company . . ., violating their leases and contracts by purchasing material from Ritchie" (Defs.' Ex. 231, R. Vol. 5, p. 475).

Mr. Winslow further stated:—

> "No existing competition, or business, was interfered with by this contract. . . . No real estate acquired; only help employed two or three boys" (Defs.' Ex. 231, R. Vol. 5, p. 476).

The United Company agreed to pay the Ritchie Company $750 per annum with the right to cancel this annual payment at any time by paying $15,000 (Defs.' Ex. 231, R. Vol. 5, p. 476).

Seaver Process Lasting Company.

This transaction took place January 13, 1900 (P.'s Ex. 75, R. Vol. 3, p. 591). The most important reason for this purchase was that the Seaver Company had patents which stood in the way of the development of the United Company's pulling-over machine. The experimental pulling-over machine of the Seaver Company, which "could be used for pulling over uppers, but it was slower than hand work," and the experimental pulling-over machine of the United Company each embodied a mechanism believed to be indispensable to a successful pulling-over machine. If the Seaver Company obtained a patent on this mechanism the United Company would be prevented from putting out commercially its pulling-over machine upon which already there had been an expenditure of hundreds of thousands of dollars. Both the experimental pulling-over machine of the Seaver Company and its lasting machine were patented. On the other hand, there were pending suits for infringement of two of the United

Company's patents by the Seaver lasting machine (R. Vol. 1, p. 47, lines 9–11; p. 103, lines 5–10; p. 456, lines 34–37; p. 849, lines 24–29; R. Vol. 2, pp. 2086, 2087; Defs.' Exs. 231, R. Vol. 5, p. 447, and 275, pp. 759, 760).

The Seaver Company was in debt to E. B. Seaver, a majority stockholder, for more than the amount paid by the United Company (P.'s Ex. 75, R. Vol. 3, p. 591). The Seaver Company was insolvent and unable to pay its debts; it had only six employees and its business had fallen to pieces, and it is obvious that the company could have offered no competition either then or later that would have been more than negligible. The purchase was made at the earnest solicitation of Mr. Seaver, to remove the patent complications which stood in the way of the development of the United Company's pulling-over machine and to settle the existing litigation (R. Vol. 1, p. 456, lines 28–39; p. 849, lines 24–29; Defs.' Exs. 231, R. Vol. 5, pp. 447, 448, and 275, pp. 759, 760).

The pulling-over machine inventions acquired from the Seaver Company have been embodied in all pulling-over machines put out by the United Company "and the mechanism embodying those features is of the utmost importance in that machine" (Howard, R. Vol. 2, p. 2086, Cr. Ints. 1650, 1653). It was a combination of the Seaver inventions and those upon which the United Company inventors were working that resulted in the present commercial pulling-over machine, in the development of which nearly a million dollars was spent (R. Vol. 2, pp. 2086, 2087, 2552). At that time the machine was only experimental and it did not become commercially successful for over two years (R. Vol. 2, p. 2542).

The lasting machine inventions did not prove as useful as was expected. In all respects the United Company's lasting machines were superior and there was no demand for the Seaver lasting machine (R. Vol. 2, p. 2087, Cr. Ints. 1654, 1655).

No real estate was acquired from the Seaver Company; it did its business in a leased room (Defs.' Ex. 231, R. Vol. 5, p. 447). Plaintiff's Exhibit 75 (R. Vol. 3, p. 591) recites that "the said Seaver Company is insolvent and is unable to continue its business or to pay its debts."

Erastus E. Winkley and Benjamin Phillips.

This transaction took place March 16, 1900 (P.'s Ex. 77, R. Vol. 3, p. 615). By the agreement with Winkley and Phillips, the United Company simply—

> "exercised the option which had previously existed between the Goodyear Company and Winkley and Phillips to take the exclusive right to the use of certain patents which had been transferred by Winkley and Phillips in 1898 to the Goodyear Company"

and under which they had reserved certain rights which were the subject-matter of this transaction (Defs.' Ex. 231, R. Vol. 5, p. 467).

Winkley and Phillips were not engaged in manufacturing anything. "No manufacturing plant of any kind was acquired" (Defs.' Ex. 231, R. Vol. 5, p. 468). Mr. Winkley is an inventor and Mr. Phillips is a patent lawyer (R. Vol. 1, p. 102, lines 38–39).

> "They did not have any going machine. Winkley and Phillips were associated with the United Company, and this was a friendly arrangement by which the United Company acquired the right to use the inventions of their patents in its machine" (Howard, R. Vol. 1, p. 48, lines 5–9).

These patents were named by Mr. Howard (R. Vol. 1, p. 48, lines 5–9; R. Vol. 2, p. 2062, Int. 1532). No machinery was acquired from Winkley and Phillips (R. Vol. 1, p. 48, lines 3–5).

The patented inventions acquired from Winkley and Phillips were embodied by the United Company in the Atlas Leveling Machine which is adapted peculiarly for use on McKay shoes (R. Vol. 2, p. 2584).

The United Company had no machine which could be used for leveling McKay shoes, while, on the other hand, the Atlas Leveling Machine cannot be used for leveling welt or turn shoes. The practical reasons why these different kinds of shoes require entirely different types of machines were pointed out in detail by Mr. Howard (R. Vol. 1, p. 102, lines 14–34; R. Vol. 2, pp. 2576–2579, Int. 106). The importance of the

inventions of the Winkley and Phillips patents was fully explained by Mr. Howard in his discussion of "Leveling Machine: Atlas" (R. Vol. 2, p. 2584 *et seq.*).

Since this acquisition—

> "the inventions acquired from Winkley and Phillips were experimented upon and developed, with the addition of other inventions, into a machine which was suitable for commercial use, and was put out for commercial use" (Howard, R. Vol. 2, p. 2062, Int. 1530).

The United Company has since continuously supplied the Atlas leveling machine to the trade and has put out about 500 machines (R. Vol. 2, p. 2084, Cr. Ints. 1631–1634). It is a General Department machine and is sold outright (R. Vol. 1, p. 12, line 37 *et seq.*; Vol. 2, p. 2587; Vol. 5, pp. 425, 427, line 3).

Stanley Manufacturing Company.

By this transaction, which took place March 19, 1900, the United Company acquired simply certain machines, parts and supplies which the Stanley Company had on hand at Frankfurt, Germany. This appears plainly from the agreement (P.'s Ex. 78, R. Vol. 3, p. 620), which provides,—

> "That the said United Company shall purchase from the said Stanley Company the stock of machines, parts and supplies which it now has on hand at Frankfurt, Germany, and in transit to Frankfurt, and all accounts and bills owing to the said Stanley Manufacturing Company in Germany."

For these parts the United Company paid cost prices with certain deductions (R. Vol. 3, p. 620).

The Stanley Company was putting out miscellaneous general department machines, the most important of which was a McKay sewing machine. "The United Company was then putting out no machine for doing the work of any one of those machines" (Howard, R. Vol. 1, p. 48, lines 19–21, 26–27; Winslow, Defs.' Ex. 231, R. Vol. 5, p. 451).

As stated by Mr. Winslow (Defs.' Ex. 231, R. Vol. 5, p. 451):—

> "The store in Germany acted as the agent for the McKay Shoe Machinery Company in handling its McKay

Heeling and Metallic Machines and parts, and this purchase amounted only to the acquirement of the selling agency for the goods manufactured by the Stanley Company in the United States."

"The reason for the purchase was that the United Company was establishing its own German Company and the local manager for the Stanley Company's business in Germany was sick, or had just died, and the Stanley Company desired to have the United Company take over its store and stock of goods and act as agents for the Stanley Company, if the United Company was going to do its own business in Germany.

"The contract, therefore, amounted simply to an agency contract, and that in itself necessitated the purchasing of the stock that the Stanley Company had in Frankfurt."

The agreement contained a covenant—

"that the said United Company shall use its best endeavors to sell in foreign countries, machines made by the said Stanley Company . . ."

and provided that in case the United Company should discontinue the purchase from the Stanley Company and sale—

"of any of the machines, parts or supplies made by the said Stanley Company . . . the said Stanley Company may then and thereafter sell such machines, parts or supplies thus discontinued to any and all persons without respect to the country to which they are to be sent.

"That the said Stanley Company may advertise and create and maintain in all proper business ways a demand for its machines in any and all countries in the world" (P.'s Ex. 78, R. Vol. 3, pp. 621, 622).

Lincoln Sewing Machine Company.

Contrary to the statement in the petition, the United Company by its agreement with the Lincoln Company, April 6, 1900 (P.'s Ex. 80, R. Vol. 3, p. 628), did not acquire the business of the Lincoln Company, nor did it acquire anything new whatsoever (R. Vol. 1, p. 49, lines 36–37). As is clear from the plain terms of the agreement, it was entered into simply for the purpose of canceling an obligation arising from

a previous contract made in 1897 (P.'s Ex. 79, R. Vol. 3, p. 623) between the Lincoln Company and the Goodyear Shoe Machinery Company, whereby the Goodyear Company was to pay a sum of money to the Lincoln Company each year for forty-nine years. Mr. Winslow testified to this effect (R. Vol. 1, p. 464, lines 9–13; see also Howard, R. Vol. 1, p. 49, lines 22–35). The reason for canceling the original obligation was "to avoid the necessity for maintaining the Goodyear Company as a separate organization and to transfer the Goodyear Company's property to the United Company" (Winslow, Defs.' Ex. 231, R. Vol. 5, p. 471).

The original agreement between the Lincoln Company and the Goodyear Company (P.'s Ex. 79, R. Vol. 3, p. 623) effected the transfer of patent rights (R. Vol. 2, pp. 2063, 2064, Ints. 1537–1539).

Boston Fast Color Eyelet Company.

This transaction took place June 30, 1900 (P.'s Ex. 81, R. Vol. 3, p. 630). As stated in the petition, this company was engaged in the manufacture and sale of "eyelets covered with celluloid." These eyelets are known as "fast color eyelets" and the Boston Company had a registered trademark, "Fast Color." The Boston Company owned patents on the eyelet, the dies for making the eyelet, and the method of covering the eyelet. The celluloid covering makes the eyelet expensive so that it has never been used except on the better grades of shoes and never at any time on more than ten per cent. of the shoes made. Its advantage is that it never wears down to the metal. (R. Vol. 1, p. 50, lines 40–45; p. 51, lines 1–5; p. 98, lines 26–27; R. Vol. 2, p. 2053, Int. 1487).

Prior to this acquisition neither the United Company nor any of its associate companies was engaged in the manufacture of eyelets or of machinery for making them (R. Vol. 1, p. 50, lines 10–13), and—

> "The United Company could not extend its field to include the manufacturing and marketing of fast color eyelets without acquiring the broad patents owned by the Boston Fast Color Eyelet Company which dominated that field" (Defs.' Ex. 275, R. Vol. 5, p. 760).

The business of the Boston Fast Color Eyelet Company was continued by the United Fast Color Eyelet Company, thus preserving the name "Fast Color." "That name was a very valuable asset" which "had designated this type of eyelet since it was invented." Since the acquisition, the fast color eyelet has been improved in ways that have made it possible to reduce its price and many new sizes have been made (Howard, R. Vol. 1, p. 50, lines 17–18; p. 99, lines 31–32, 36–37).

The Boston Fast Color Eyelet Company owned no real estate and did no manufacturing; their eyelets were manufactured by other parties under contract (Defs.' Ex. 231, R. Vol. 5, p. 461).

Enamel Eyelet Company.

This transaction took place June 30, 1900 (P.'s Ex. 83, R. Vol. 3, p. 645). The Enamel Eyelet Company was owned by the same people who owned the Boston Fast Color Eyelet Company, and this acquisition was "a part of the same transaction by which the stock of the Boston Fast Color Eyelet Company was acquired." The Enamel Company was attempting unsuccessfully to manufacture the type of eyelet known as the "enamel eyelet." "There was no competition whatever between the Boston Company and the Enamel Company." The differences in the constructions of the enamel eyelet and the fast color eyelet and in their fields are pointed out by Mr. Howard (Howard, R. Vol. 1, p. 51, lines 28–29; p. 98, lines 28–45; p. 99, lines 1–10, 13–18; Defs.' Ex. 275, R. Vol. 5, p. 760; Winslow, R. Vol. 1, p. 462, lines 13–14).

At the time of this acquisition neither the United Company nor any of its associate companies was engaged in the manufacture of eyelets (R. Vol. 1, p. 50, lines 10–12), and—

> "had it not acquired control of the Enamel Company the United Company could not have entered the enamel eyelet field without subjecting itself to the liability of suit under the Enamel Company's design patent 24,867, November 12, 1895, Kempshall. The Enamel Company had brought and vigorously prosecuted suit on that

patent against John C. Rhodes" (Howard, Defs.' Ex. 275, R. Vol. 5, p. 760).

By this acquisition the United Company made substantial progress in clearing up the patent situation in the enamel eyelet field. It proved, however, that the United Company had otherwise made no progress in the way of entering the enamel eyelet field; for although these people "knew well how to make fast color eyelets they did not know how to make enamel eyelets and were not producing a satisfactory enamel eyelet. We had to junk a large supply we had on hand which we couldn't get rid of." But the United Company continued to supply the Enamel Company's eyelets so far as there was any demand, and "if manufacturers would buy them, we should be glad to sell them" (Howard, R. Vol. 1, p. 99, lines 13–18, 25–30).

The division of the preferred stock issued in payment for the Boston Fast Color Eyelet Company and the Enamel Eyelet Company, as stated in the petition, was purely arbitrary, and at the request of the common owners of the two companies.

No real estate was acquired in this transaction. The Enamel Company did no manufacturing but had their eyelets made by others (Defs.' Ex. 231, R. Vol. 5, p. 461).

Ross-Moyer Manufacturing Company.

This transaction took place September 20, 1900 (P.'s Ex. 87, R. Vol. 3, p. 658). The Ross-Moyer Company had stores in Chicago and Cincinnati. It leased floor space in Cincinnati and employed thirty-five men. It had been in business for many years, and was putting out nineteen machines of "what are now known as the general department type." The patents on these machines were named by Mr. Howard (Howard, R. Vol. 1, p. 52, lines 40–43; p. 100, lines 31–41; p. 101, lines 16–30; Winslow, R. Vol. 1, p. 408, lines 23–24; p. 459, line 7; Defs.' Ex. 231, R. Vol. 5, p. 451).

With a single exception the United Company had no machines for doing the work of the machines acquired from the Ross-Moyer Company (R. Vol. 1, p. 101, lines 12–15).

"The acquisition of these machines was the first step toward the creation of the United Company's general department," and the machines acquired were the foundation of its general department (Howard, R. Vol. 1, p. 53, lines 3–5; p. 100, lines 42–43).

Another reason for this acquisition was the desire of the United Company to establish its own agencies in Cincinnati and Chicago, and to do this without taking away from the Ross-Moyer Company the business which it had been carrying on for many years as agent for the McKay Shoe Machinery Company and the Consolidated & McKay Lasting Machine Company (R. Vol. 1, p. 409, lines 2–5, 11–13; p. 418, lines 38–40), and which it was still carrying on for the United Company. The value and nature of the service rendered by the United Company are fully discussed elsewhere, and need not be dwelt upon at this time. The importance of having its service headquarters, supplies of parts, and material for all of its machines in one place in each trade centre and of having the service, supplies of parts, and materials for its machines entirely in its own control is obvious. The disadvantages of duplications of service, supply depots, and corps of "traveling mechanics and instructors" visiting the same factories, traveling to the same places, and carrying parts to the same places under conditions such as existed prior to 1899 are pointed out by Mr. Winslow (R. Vol. 1, p. 408, lines 7–44; p. 409; p. 410, lines 1–16). Accordingly—

> "The United Shoe Machinery Company desired to establish its own stores and offices in each one of the shoe manufacturing centres, for the purpose of furnishing a better service in connection with its machines than had heretofore been possible by each of the separate companies, and to carry a proper supply of spare parts and material used in its machines" (Defs.' Ex. 231, R. Vol. 5, p. 452).

Mr. Ross "at once took up the question with us as to where they would fit into the new company." Of course, when the concerns which had been agents for the old companies learned of the United Company's intention to establish its own headquarters they were much concerned. "In all of these cases the moving motive in making these arrangements was from

Mr. Ross in the Ross-Moyer, and Smith, and representatives of the Krieg estate, who wanted in the rearrangement to make the best arrangements for themselves" (Winslow, R. Vol. 1, p. 418, lines 36–45; p. 419, lines 42–44; p. 420, lines 1–2).

Mr. Winslow further stated:—

> "these concerns would necessarily lose the business which they had done acting as agents for the various companies, and it formed such a large portion of their whole business that they desired to have the United Company take over all their business relating to shoe machinery, or supplies, when the United Company was ready to establish its own offices."
>
> "An additional reason for the purchase of Ross-Moyer was to secure the services of Mr. Samuel Ross, who had long been associated with the McKay Company and was an experienced shoe machinery man and well liked by the trade. The United Company desired to secure his services to represent their interests throughout the middle west" (Defs.' Ex. 231, R. Vol. 5, p. 453).

This led to "the employment of Mr. Ross as the western agent of the company, in charge of all the western offices." He "was our general agent in the West until two or three weeks ago, when he died" (Winslow, R. Vol. 1, p. 419, lines 5–6, 10–12). Plaintiff's Exhibit 87 (R. Vol. 3, p. 658) is the employment agreement made with Mr. Ross.

Mr. Winslow testified (R. Vol. 1, p. 419, lines 7–10):—

> "There was absolutely nothing more in our doing that than our purpose of doing the square thing by Mr. Ross. They had been connected with the McKay Company and the Lasting Company for years; part of our own family, so to speak."

Since this purchase, the business has been carried on by the Ross-Moyer Manufacturing Company, all the machines of the Ross-Moyer Company being put into the United Company's General Department and sold. The United Company did not raise the prices or limit the sale or manufacture of these machines. "The only thing that happened regarding those machines was that we made them better than the Ross-Moyer. The trade was benefited in that respect." Also, the Ross-Moyer Company was made a depot for spare parts and the

headquarters of the United Company's repair force for the Cincinnati and Chicago districts (R. Vol. 1, p. 53, lines 8–9; p. 95, lines 28–35; p. 100, lines 42–44; p. 101, lines 1–2, 8–11; Winslow, R. Vol. 1, p. 459, lines 15–24).

Bay State International Shoe Machinery Company.

This transaction took place January 30, 1901 (P.'s Ex. 86, R. Vol. 3, p. 655). This company was organized to do foreign business and did not do any business in the United States, its only business being in England (R. Vol. 1, p. 52, lines 18–20; p. 101, lines 34–35). It had put out about ten sets of its machines in England (R. Vol. 2, p. 2059, Int. 1519). It owned no real estate and did no manufacturing business. Its machines were manufactured in Montreal, Canada; none whatever in this country. Its machines were covered by English and French patents. They were a welter, stitcher and rough rounder, which were distinctly inferior to the United Company's machines and were very different in construction (R. Vol. 1, p. 52, lines 20–21; p. 101, lines 31–33; R. Vol. 2, p. 2059, Ints. 1517–1518; p. 2085, Cr. Ints. 1642–1644; Defs.' Ex. 231, R. Vol. 5, p. 448).

Since this company was not organized to do business between Great Britain and the United States, did no such business, and did no business in the United States, obviously this acquisition has absolutely no bearing upon this case.

Machines of the Bay State International Shoe Machinery Company infringed claims of two of the United Company's English patents. The United Company owned continental patents corresponding to those two English patents (Defs.' Ex. 275, R. Vol. 5, p. 761).

The purchase was made "at the earnest solicitation of the people who were interested, who were also customers, shoe manufacturers, and customers of the United Company," because it was believed to be "the cheapest way to settle and dispose of the litigation." "This was a purchase of foreign patents," and the consideration was $25,000 in preferred stock of the United Company (Winslow, R. Vol. 1, p. 457, lines 21–26; Defs.' Ex. 231, R. Vol. 5, p. 448).

Swain-Fuller Manufacturing Company.

This transaction took place February 2, 1901 (P.'s Ex. 88, R. Vol. 3, p. 660). The Swain-Fuller Company was doing "a very small business" (R. Vol. 1, p. 53, line 18). "They owned no real estate; they leased a small amount of floor space in Boston; employed less than ten men" (Winslow, R. Vol. 1, p. 459, lines 25–27). Its principal business was manufacturing and putting out a machine of the "General Department" type known as the "Star Leveling Machine" for turn shoes, which was patented (R. Vol. 1, p. 53, line 18; p. 100, lines 22–24; R. Vol. 2, pp. 2054, 2055, Int. 1491).

> "The Star machine was a very light machine and was adapted and used only for leveling turn shoes, which, owing to the fact that they have but one sole, require and will stand a less degree of pressure than other types of shoes" (Howard, R. Vol. 2, p. 2063, Int. 1533).

Prior to this acquisition the United Company was not putting out any leveling machine adapted for use on turn shoes. "It would be impossible to use any machine that the United Company then had on turn shoes." On the other hand, "the Star machine could not be used with commercial profit on other work. It was too light and exerted too light a pressure for Goodyear work" (Howard, R. Vol. 1, p. 53, lines 20–24).

An important reason for this acquisition was the desire of the United Company to obtain a leveling machine adapted for leveling turn shoes, which it had not had before (Defs.' Ex. 275, R. Vol. 5, p. 761).

Another important reason for this acquisition was that the United Company had produced and desired to use a sole pressing form for sole laying machines, shown and described in Gifford patent No. 694,367, which infringed a patent owned by the Swain-Fuller Company (Defs.' Ex. 275, R. Vol. 5, p. 761).

Mr. Winslow stated: "This property was acquired at the solicitation of Mr. Fuller, who was the principal owner and desired to go out of shoe machinery business" (Defs.' Ex. 231, R. Vol. 5, p. 454). Mr. Winslow also testified: "We did not seek the Swain Fuller Company; they sought us" (R. Vol. 1,

p. 459, line 34). The importance of the transaction is indicated by the amount paid,—$13,201.92 (Defs.' Ex. 231, R. Vol. 5, p. 455).

After the purchase, the Star Leveling Machine was manufactured and put out by the United Company and was its standard machine for leveling turn shoes (R. Vol. 2, p. 2055, Ints. 1493, 1494; Defs.' Ex. 275, R. Vol. 5, p. 761). It is a General Department machine and is sold outright (R. Vol. 1, p. 12, line 37 *et seq.;* Vol. 5, pp. 425, 427, line 6). Also the United Company used on its commercial sole-laying machine, the one which it had previously acquired from the Boot & Shoe Sole Laying Company, the pressing form of the Gifford patent, which, as above explained, had infringed a patent owned by the Swain-Fuller Company (Defs.' Ex. 275, R. Vol. 5, p. 763).

Globe Sewing Machine Company.

This transaction took place February 15, 1901 (P.'s Ex. 89, R. Vol. 3, p. 662). The Globe Sewing Machine Company—

> "were attempting to use the same machine for sewing the welt to the upper and insole and for stitching the outsole to the welt. They had a lockstitch machine for both operations, and used some attachments for one operation and other attachments for the other."

It was not successful. They also had an experimental rough rounder. All of these machines were patented (Howard, R. Vol. 1, p. 100, lines 5–21; p. 104, lines 33–37; p. 528, lines 7–8; R. Vol. 2, p. 2002, Int. 1234). Mr. Winslow testified:—

> "The purchase was not one that the United Company sought, but was made at the earnest solicitation of Mr. Mellen Bray, to whom the Globe Company owed a very large sum of money. He wanted to get rid of having anything to do with the company, and came to me personally and besought me to acquire his interest. They owned no real estate and did no manufacturing. Such as they had done they had contracted outside" (Winslow, R. Vol. 1, p. 457, lines 5–12).

The Globe Company owed Bray $86,984 (R. Vol. 3, p. 665). The United Company paid $20,000 in its preferred stock for

a majority of the stock of the Globe Company (Defs.' Ex. 231, R. Vol. 5, p. 448, R. Vol. 1, p. 457, lines 13–18).

As explained by Mr. Howard in full detail, many of the patented features of the Globe lockstitch welter gave that machine marked superiority over the lockstitch welter which the United Company had just begun to put out (R. Vol. 2, pp. 2004, 2005, Ints. 1241, 1242).

On the other hand, all the Globe Company's machines infringed patents owned by the United Company. There were pending one infringement suit brought by the United Company against the Globe Company and five suits against users of the Globe Company's machines (Defs.' Ex. 275, R. Vol. 5, p. 762).

By this acquisition the United Company acquired control of the patents of the Globe Company which stood in the way of development by the United Company of its lockstitch welter, settled the existing patent litigation and avoided further patent litigation.

In explaining why the inventions of the Globe Company's patents were not adopted by the United Company, Mr. Howard testified:—

> "These two features of superiority, together with others of less striking importance, would undoubtedly have been adopted in the United Company's lockstitch welting machine had it not been for the fact that shortly after the acquisition of the Globe Company's patents shoe manufacturers decided that they did not desire to sew the inseam by a lockstitch, and they refused to use lockstitch welters. In the year ending March 1, 1902, we put out only nine lockstitch welters, and six were returned; in the year ending March 1, 1904, we did not put out any machines, and five were returned. By 'any machines' I mean of course lockstitch welting machines" (R. Vol. 2, p. 2005, Int. 1242).

In Mr. Howard's detailed discussion of the United Company's lockstitch welting machine, known as "Sewing Machine: Goodyear Universal Inseam," he explained that manufacturers "found that it was impossible to secure the tight inseam, which is indispensable in the inseam of a welt shoe" (R. Vol. 2, p. 2251, Int. 11).

In view of the facts above stated and particularly in view of the large indebtedness of the Globe Company stated in

Plaintiff's Exhibit 89 (R. Vol. 3, p. 665), as amounting to $92,075.69, it is perfectly clear that the Globe Company did not offer even potential competition to the United Company and that this transaction is of no importance.

J. C. Rhodes & Company.

This transaction took place June 19, 1901 (P.'s Ex. 91, R. Vol. 3, p. 668). "This company was an old, established eyelet-making concern" which "owned its own real estate and factory at New Bedford, Mass., employing about one hundred and sixteen men" (Winslow, Defs.' Ex. 231, R. Vol. 5, p. 461). They manufactured "a patented enamel eyelet, which was the one in general use at that time" (Howard, R. Vol. 1, p. 51, lines 41–42; p. 98, lines 16–17).

Their patent No. 565,091, August 4, 1896, contained—

> "broad claims to an enamel eyelet so constructed as to prevent breaking of the enamel coating by the pressure exerted in the eyelet setting operation."
>
> "Otherwise the flange would bend in the setting operation and the enamel would crack. That feature has never been dispensed with in any enamel eyelet which was commercially satisfactory" (Howard, Defs.' Ex. 275, R. Vol. 5, p. 764; R. Vol. 1, p. 98, lines 42–44).

The United Company had previously acquired the stock of the Enamel Eyelet Company, but—

> "Both the Rhodes eyelet and the Enamel eyelet were patented, and as a matter of fact each company was infringing the other's patent. The Enamel Company's eyelet was never a commercial success" (Howard, R. Vol. 1, p. 51, lines 43–44; p. 52, lines 1–2).

A suit had been brought by J. C. Rhodes & Company against "a user of the enamel eyelet put out by the Enamel Eyelet Company" (Howard, R. Vol. 2, p. 2080, Int. 1615). On the other hand: "The Enamel Eyelet Company had brought and was vigorously prosecuting a suit against John C. Rhodes for infringement of its design patent 24,867, November 12, 1895, Kempshall" (Howard, Defs.' Ex. 275, R. Vol. 5, p. 763).

By this acquisition the United Company accomplished three important objects: (1) It cleared up a complicated patent situation. If the eyelet of the Enamel Company had been commercially satisfactory, the United Company could not have put it out without infringing the Rhodes patent. (2) The United Company was able to put out a commercially satisfactory enamel eyelet without infringing the broad Rhodes patent. (3) It was able for the first time to procure satisfactory metal blanks for its fast color eyelets. "Prior to that time those blanks, which had been procured from different sources, had not been satisfactory" (Howard, Defs.' Ex. 275, R. Vol. 5, p. 764; R. Vol. 1, p. 591, lines 31–33).

With this acquisition the United Company really entered the enamel eyelet field for the first time. As explained in discussing the Enamel Eyelet Company,—

> "they did not know how to make enamel eyelets and were not producing a satisfactory enamel eyelet. We had had to junk a large supply we had on hand which we couldn't get rid of" (Howard, R. Vol. 1, p. 99, lines 15–18).

The United Company was at that time engaged in the manufacture of fast color eyelets, but the fast color eyelet—

> "was much more expensive than the enamel eyelet and was used only on the highest grade of shoes, never at any time on more than ten per cent of the shoes made."

The celluloid covering on the flange of the fast color eyelet makes it expensive, so that it has never been used except in the better grades of shoes (Howard, R. Vol. 1, p. 50, lines 41–45; p. 51, lines 1–5).

The enamel eyelet comprises a metal eyelet having a flange of the contour desired for the finished eyelet, which flange is coated with enamel, while in the fast color eyelet the flange merely serves to anchor the thick celluloid covering. The enamel eyelet is much less expensive and the enamel wears off after a time so that the eyelet has a brassy appearance and accordingly enamel eyelets are used only on the cheaper grades of shoes. There was no competition between fast color eyelets and enamel eyelets (R. Vol. 1, p. 51, lines 6–13; p. 98, lines 28–45; p. 99, lines 19–21).

The business of J. C. Rhodes & Company was continued by J. C. Rhodes & Company, Inc. Since the purchase, the factory facilities have been increased by building a large new factory (Defs.' Ex. 231, R. Vol. 5, p. 461).

The United Company continued to sell the Rhodes eyelets at the same prices at which they had been sold by the Rhodes Company,—

> "and in addition furnished the eyeletting machines in which the eyelets were used without charge to our customers, with no increase whatever in the prices; but the eyelets were sold to anyone, whether they used our machines or not" (Winslow, R. Vol. 1, p. 463, lines 39–43).

Also the Rhodes eyelet has been much improved and "many new sizes have been made which were not made in 1901" (Howard, R. Vol. 1, p. 99, lines 36–39).

Morley Button Manufacturing Company.

This transaction took place on December 14, 1901 (P.'s Ex. 92, R. Vol. 3, p. 675).

> "The Morley Button Manufacturing Company was primarily a button manufacturing company, manufacturing and selling buttons. In addition to this button business it was engaged in the business of manufacturing and selling a patented enamel eyelet. . . . The United Company acquired only the eyelet business of the Morley Company, and that company is now engaged in the business of manufacturing and selling buttons and similar articles as before" (Howard, R. Vol. 1, p. 54, lines 30–39).

"The United Company acquired no real estate or manufacturing plant with this purchase . . . the eyelet business was a very small part of its total business" (Winslow, Defs.' Ex. 231, R. Vol. 5, p. 462). The novel patented feature of the Morley eyelet was that the enamel coating did not extend down inside of the barrel.

> "This was different from both the Rhodes and Enamel Company eyelets. It was claimed that it was objection-

able to have the enamel inside the barrel. They made the eyelet by a secret process and by a secret formula" (Howard, R. Vol. 1, p. 99, lines 6–10).

By the process followed in making the Rhodes eyelet the inside of the barrel was covered with enamel.

Although the Rhodes and Morley eyelets were of different types, the Morley eyelet embodied the broadly patented feature of the Rhodes eyelet (R. Vol. 1, p. 98, lines 40–42; p. 99, line 4). At the time of this acquisition there were pending two suits brought by J. C. Rhodes & Company, Inc., against the Morley Company on Rhodes patent No. 565,091, August 4, 1896, and Kempshall design patent No. 24,867, November 12, 1895 (R. Vol. 2, p. 2080, Int. 1615). One of the considerations stated in the agreement for the sale of the Morley Company's business and patents was a covenant by the United Company that it would cause these two suits to be dismissed without costs and cause J. C. Rhodes & Company, Inc., to release the Morley Company from all claims for damages or profits on account of the infringement of the patents in suit. Another consideration was a further covenant that the Morley Company should be licensed under these two patents to manufacture eyelets in process to fill the orders which it had on hand (R. Vol. 3, pp. 677, 678; R. Vol. 2, p. 2081).

Mr. Winslow stated,—

"This purchase was made in 1901 as the best method of settling the litigation . . . and was believed to be a fair and equitable settlement of the existing situation, and by it the Rhodes Company acquired certain patents on eyelets which were valuable to it" (Defs.' Ex. 231, R. Vol. 5, p. 462).

The price paid was $31,000, for which the United Company obtained one patent and one application for a patent, and machinery, for making the Morley eyelets, etc., inventoried at $17,541.99 (R. Vol. 3, pp. 676, 677, 681).

The Morley eyelet was used on a cheaper grade of shoes than the Rhodes eyelet, but, after the acquisition, manufacturers demanded the superior Rhodes eyelet for all grades of

cheaper shoes and the demand for the inferior Morley eyelet was so small that it was supplied from the stock on hand, but so far as there was any demand for Morley eyelets the United Company has supplied them (Howard, R. Vol. 1, p. 99, lines 23–24, 28–30).

Oliver A. Miller.

This transaction took place February 15, 1902 (P.'s Ex. 93–95, R. Vol. 3, pp. 683, 687, 690). Miller was engaged in the manufacture of treeing machines, and tree legs and tree feet that are used on, and are parts of, treeing machines, which are used in all factories for cleaning and blacking shoes before they are packed (R. Vol. 1, p. 464, lines 29–34; p. 97, lines 42–45).

Mr. Winslow testified,—

> "We had no such machines. We were not in competition not in the slightest degree" (R. Vol. 1, p. 464, lines 37–38).

Mr. Howard testified,—

> "This was absolutely a new branch for the United Company. It had nothing of the sort before" (R. Vol. 1, p. 98, lines 3–4).

The purchase was made by the United Company "entirely for the purpose of extending its business" (Winslow, Defs.' Ex. 231, R. Vol. 5, p. 476). Miller's treeing machines, tree legs and tree feet were patented (R. Vol. 1, p. 98, lines 5–8).

Miller had become involved in financial difficulties, needed money and wished to sell; "he came to us and wanted to dispose of the business," negotiations being opened through Frank Hannigan, his manager (Winslow, R. Vol. 1, p. 464, lines 35–37; Defs.' Ex. 231, R. Vol. 5, p. 476).

> "The reputation of the Miller machines and the Miller business was high, and we found that we could secure the manager of that business, who had been with Mr. Miller for a great many years, to continue as manager for us,

and we finally accepted the company and continued that business" (Winslow, R. Vol. 1, p. 464, lines 38–43).

The Miller treeing machine business "has been continued by the O. A. Miller Treeing Machine Company, of which Mr. Hannigan, a minority stockholder, is manager" (Howard, R. Vol. 1, p. 55, lines 14–16), in the factory which was acquired from Miller, and which has been largely extended. The business has increased, 125 men are now employed there; Miller employed 65 men (R. Vol. 1, p. 465, lines 3–7; Defs.' Ex. 231, R. Vol. 5, p. 476).

Marlboro Awl & Needle Company.

This transaction took place June 30, 1902 (P.'s Exs. 96–97, R. Vol. 4, pp. 693, 703). This company owned no real estate, leased floor space in Marlboro and employed twelve men (Defs.' Ex. 231, R. Vol. 5, p. 462). It manufactured needles, awls and rawhide mallets (R. Vol. 1, p. 467, lines 3–7; R. Vol. 5, p. 476). The needles were for use in the McKay sewing machine; the awls were chiefly "hand awls, such as cobblers use for shoe repairing"; the mallets were rawhide mallets "used by shoe makers and cobblers" (Howard, R. Vol. 1, p. 97, lines 27–41). Neither the United Company nor any of its subsidiary companies was manufacturing needles of any kind, hand awls or rawhide mallets (R. Vol. 1, p. 55, lines 36–39).

A small company was formed called the United Awl and Needle Company and the Marlboro Company's business has been continued by the United Awl and Needle Company at its factory at West Medway, where it has employed twenty-eight or thirty men (R. Vol. 1, p. 55, lines 41–43; Defs.' Ex. 231, R. Vol. 5, p. 462).

The unimportance of this transaction is indicated by the facts above stated and by the amount of the consideration, $16,300 in preferred stock of the United Awl and Needle Company (Defs.' Ex. 231, R. Vol. 5, p. 462).

The T. A. Norris Machine Company.

This transaction is not named in its proper chronological order in the petition (R. Vol. 1, p. 1011). It took place July 1, 1902 (P.'s Ex. 102, R. Vol. 4, p. 734),—not in March, 1903, as stated in the petition.

The T. A. Norris Machine Company had no real estate, but operated a small machine shop in Brockton, employing about ten men, in which they did general machine shop work. "It was really a repair shop" (Winslow, R. Vol. 1, p. 460, lines 7–10). Their business was chiefly in second-hand machines, or, as Mr. Gregg puts it, "I think this company was more of a dealer than anything else," but they had manufactured for them six simple, minor machines (R. Vol. 1, p. 59, lines 19–23, 26–27; p. 93, lines 39–45; p. 460, lines 9–10).

The United Company had no machines for performing the operations of any of the six machines acquired from the Norris Company or even for doing similar work (R. Vol. 1, p. 59, lines 28–38; p. 94, lines 1–28).

The machine shop of the Norris Company was located in a building owned by T. A. Norris personally, in which building the United Company had its Brockton headquarters and repair shop, which it held under lease from Norris.

Mr. Winslow testified,—

> "This purchase was made upon the basis of the inventory, $11,526.78, and at the solicitation of Mr. Norris, who was heavily interested in real estate and wanted to retire from any machinery business" (R. Vol. 1, p. 460, lines 14–17; Defs.' Ex. 231, R. Vol. 5, p. 456).

As to the reasons for this purchase:—

(1) Mr. Winslow testified: "We wanted to increase our space in his building, and this business arrangement was made" (R. Vol. 1, p. 460, lines 17–18; R. Vol. 5, p. 456).

(2) The United Company extended its line of machines by adding to it the six "General Department" machines acquired from the Norris Company (R. Vol. 1, p. 461, lines 5–6).

(3) "Lasting machine parts were carried by the T. A. Norris Machine Company" (Winslow, R. Vol. 5, p. 453).

Consistently with its policy of having under its own control the supply of parts and the furnishing of service for its machines, as explained in the Ross-Moyer discussion (*supra* pp., 680–683), it was important for the United Company to continue this agency itself and in this instance, as in the other similar transactions, a fair adjustment of the situation was to take over the business of its former agent.

Since the purchase the United Company has continued putting out all the machines which it acquired from the Norris Company, and has operated the Norris machine shop as a repair shop (Defs.' Ex. 231, R. Vol. 5, p. 456).

American Sole Laying Machine Company.

This transaction took place September 25, 1902 (P.'s Ex. 98, R. Vol. 4, p. 705). The chief business of the American Sole Laying Machine Company was putting out a two-form laying machine which they were manufacturing under a license from the Tripp Giant Leveler Company under "the famous Cutcheon patent" (Howard, R. Vol. 1, p. 56, lines 15–18; p. 96, lines 33–34).

> "That machine had right and left forms and operated on a pair of shoes, rights and lefts, at one time, one being under pressure while the operator was putting the other in position to go into the machine" (Howard, R. Vol. 1, p. 96, lines 29–33).

The American Company also owned patents on their machine which prevented the United Company from adopting a satisfactory pad (R. Vol. 1, p. 96, lines 43–45; p. 97, lines 20–26). It "owned no real estate and did no manufacturing. Contracted with outside parties for such machines as it had built." This company was purchased for $5200 at the solicitation of Mr. Fuller, "who was the principal owner and desired to spend his time in the South" (Winslow, Defs.' Ex. 231, R. Vol. 5, p. 475). The agreement sets forth that "Fuller is the owner of a majority of the capital stock" and that "Fuller controls the actions of said company" (P.'s Ex. 98, R. Vol. 4, p. 705). Mr. Fuller had also been the principal owner and treasurer

of the Swain-Fuller Manufacturing Company, which had previously sold out its business to the United Company (Defs.' Ex. 231, R. Vol. 5, p. 455; P.'s Ex. 88, R. Vol. 3, p. 661).

> "The standard commercial machine of the United Company at that time was the machine which it had acquired from the Boot and Shoe Sole Laying Company . . . but that was a one-form or single machine" (Howard, Defs.' Ex. 275, R. Vol. 5, p. 765).

Mr. Howard further testified:—

> "We desired to turn this single machine into a double machine and we were able to do that after this transaction, in which we acquired the license which the American Company had under the Cutcheon patent. Counsel advised us that this license was assignable" (R. Vol. 1, p. 56, lines 25–29; p. 96, lines 38–40).

This license was also needed by the United Company to enable it to develop the Atlas leveling machine (Defs.' Ex. 231, R. Vol. 5, p. 475).

The Cutcheon patent had been sustained by the Court of Appeals in the First Circuit (Defs.' Ex. 275, R. Vol. 5, p. 765) and the patent expert for the United States, Mr. Chapman, described this patent as a pioneer and basic patent (R. Vol. 2, pp. 2813, 2814, Int. 15).

> "After this acquisition we incorporated in the machine which we got from the Boot & Shoe Sole Laying Company, the inventions acquired from the American Company, particularly the two-form construction and the pad invention. In other words, we got the method of sole laying from the Boot & Shoe Sole Laying Company, and we got the double application of that method from the American Company.
>
> "By combining the inventions embodied in two machines we made a better machine than either. The new machine has right and left forms and operates twice as fast as the single machine which we had previously been putting out" (Howard, R. Vol. 1, p. 97, lines 6–16).

That machine "has been placed with our customers in very large numbers" (Howard, R. Vol. 1, p. 97, lines 18–19). Also the United Company has "put out fifty sole-laying machines

substantially the same as the machines which had been put out by the American Sole Laying Company" and "The United Company continued putting out these machines so long as there was any demand for them from shoe manufacturers" (Howard, R. Vol. 2, p. 2098).

William J. Young.

That no tangible property was acquired from William J. Young by this transaction is clear from the agreement with him made October 1, 1902 (P.'s Ex. 99, R. Vol. 4, p. 713), and from the record. "No manufacturing plant of any kind was acquired" (Winslow, Defs.' Ex. 231, R. Vol. 5, p. 468). The only property acquired was "Young's English and German patents under which our foreign companies had agencies" and under which they were putting out Young's heel-compressing machine (Howard, R. Vol. 1, p. 57, lines 13–17; p. 95, lines 44–45), and for these patents the United Company paid $14,000 (R. Vol. 4, p. 717).

> "At this time our foreign companies had been putting out Young's machines for a number of years. They had been agents for his machine" (Howard, R. Vol. 1, p. 57, lines 15–17).

Neither the United Company nor any of its affiliated companies was putting out in Europe any heel-compressing machine other than Young's, and "The United Company had not shipped a heel-compressing machine to England or Germany, the countries where Young's patents were taken, for a period of over ten years" (Howard, R. Vol. 1, p. 57, lines 17–20; p. 96, lines 18–19).

> "The machine which we had before this was an old machine, very much inferior to Young's, which was of comparatively recent invention. He preceded us by two or three years in inventing a modern, satisfactory, high-speed heel-compressing machine" (Howard, R. Vol. 1, p. 96, lines 23–27).

An important reason for this transaction is thus stated by Mr. Howard:—

"Under the requirements of the German patent law it was necessary, in order to maintain Young's German patent, to manufacture his machine in Germany right after this time, and Young had no facilities for manufacturing machines in Germany, while the United Company had a factory" (R. Vol. 1, p. 57, lines 21–25; p. 96, lines 5–9).

In view of the situation just stated by Mr. Howard, this transaction was mutually advantageous. As agent for Young the United Company had established a business with his machine and it was the only machine which it was putting out in Europe. Failure to maintain the German patent would make this machine public property in Germany. On the other hand, if Young had not sold his German patent and had failed to manufacture under it, the patent would have become worthless.

From the standpoint of the United Company another reason for this transaction was that "as the machines made by Young were not well made, customers had complained regarding their quality" (Defs.' Ex. 231, R. Vol. 5, p. 468). After acquisition of the patents the United Company could remedy this by making the machines itself.

After acquiring the German patent the United Company began to manufacture in Germany and marketed the machines there. Young continued to put out this machine in the United States and he has put it out ever since in competition with the United Company. As witness for the United States, Young testified that he has put out over 300 of these machines. Young also testified that his business has been growing and named over a dozen different types of machines which his company is putting out, many of which have been put out in large numbers (R. Vol. 1, p. 96, lines 9–11, 13–17; pp. 942, 943).

The George A. Smith Machinery Company.

This transaction took place November 20, 1902 (P.'s Ex. 100, R. Vol. 4, p. 721). The George A. Smith Machinery Company had a store in Philadelphia. It owned no real estate and did no manufacturing. It employed one man re-

pairing second-hand machinery (Defs.' Ex. 231, R. Vol. 5, p. 451). The only machine which the Smith Company was putting out was the hand-operated boss spring heel scarfing machine, which was patented (R. Vol. 1, p. 58, lines 3–5; p. 95, lines 36–39). This machine was manufactured for the Smith Company in outside machine shops (Defs.' Ex. 231, R. Vol. 5, p. 451).

The United Company was not putting out a machine for doing work similar to that of the Smith Company's machine (R. Vol. 1, p. 58, lines 5–6). After the acquisition, the United Company sold this machine through its General Department and it is still being supplied to customers (R. Vol. 1, p. 95, lines 42–43).

A controlling reason for the acquisition of the Smith Company was the desire of the United Company to establish its own agency in Philadelphia and to do this without injustice to the Smith Company or to Mr. Smith, who was the majority stockholder of the Smith Company, as set forth in Plaintiff's Exhibit 100 (R. Vol. 4, p. 721).

> "The George A. Smith Machinery Company was agent for the United Company machines, except the Goodyear machines, as it had previously, before the formation of the United Company, been agent for all the predecessors of the United Company except the Goodyear Company. That business was taken over by the United Company" (Howard, R. Vol. 1, p. 57, lines 42–44; p. 58, lines 1–3).

Like the Ross-Moyer Manufacturing Company, the Smith Company had been the agent in Philadelphia for the McKay Shoe Machinery Company and the Consolidated & McKay Lasting Machine Company, carrying in stock spare parts for all the machines of those companies and the wire used in the machines of the McKay Company and after the formation of the United Company it had continued in the same relation to the United Company (Defs.' Ex. 231, R. Vol. 5, pp. 452, 453; Vol. 1, p. 419, lines 13–17).

Mr. Winslow testified,—

> "When Mr. Smith found that we were going to unify this service and bring it all under one head, he wanted we

should buy him out, and we did acquire his business" (Winslow, R. Vol. 1, p. 419, lines 17–20; p. 418, lines 36–38).

The United Company's reasons for desiring to establish an agency in Philadelphia and the importance of so doing were the same as in the case of the Ross-Moyer Company (Defs.' Ex. 231, R. Vol. 5, p. 453), and have already been explained in the discussion of that company (*supra*, pp. 680–683).

The United Company continued the business of The George A. Smith Machinery Company except the cut soles and findings business, which was excepted from the transaction, on the premises which had been occupied by the Smith Company in Philadelphia and established the headquarters of its repair force there and carried there its supplies of machine parts and materials for use on the machines (R. Vol. 1, p. 95, lines 18–35). The consideration for this transaction was $38,790.79, the inventory value of the property acquired (Defs.' Ex. 231, R. Vol. 5, p. 451).

George W. Emerson & Company.

This transaction took place December 18, 1902. George W. Emerson & Company, a co-partnership (P.'s Ex. 101, R. Vol. 4, p. 725), owned no real estate, leased two floors in a factory building in Lynn, and employed about thirty-five men (R. Vol. 1, p. 460, lines 3–5). Their principal business was "manufacturing and supplying lasts and forms for sole leveling machines of the 'Giant' type." They were also putting out a patented power spring heel scarfer, a patented heel-burnishing machine, and a tip scourer (Howard, R. Vol. 1, p. 58, lines 24–38, 44–45; p. 94, lines 29–44).

The United Company had no tip scourer and no power operated spring heel scarfer and it was developing a leveling machine on which lasts and forms are used (R. Vol. 1, p. 58, lines 22–24; p. 59, lines 3–10; p. 94, lines 29–31; p. 95, line 1). The patented heel-burnishing machine which the Emerson concern was putting out was of "a different type" and performed its operation in an entirely different way from the United Company's machine, which was also patented. Some manufacturers preferred and insisted upon having one type

of machine, while other manufacturers preferred and insisted upon having the other type (R. Vol. 1, p. 58, lines 39–45; p. 59, lines 1–2; p. 95, lines 4–11).

There were three important reasons for this acquisition:—

(1) The United Company extended its line by adding a tip scourer, a power operated spring heel scarfer, and a new type of heel burnisher which some manufacturers preferred. It also secured a source of supply for the lasts and forms which had to be used upon the leveling machine which it was developing.

(2) "We desired to obtain the services of William R. Sampson, who was the active man with Emerson and who today occupies with our company a very prominent position and has been with us ever since" (Winslow, R. Vol. 1, p. 459, lines 41–44).

(3) "To compose certain litigation then pending between the Xpedite Company and the Emerson Company for infringement of the Xpedite patents" (Winslow, R. Vol. 1, p. 460, lines 1–3).

As to (3) the Emerson heel-finishing machine infringed eleven claims of two patents of the United-Xpedite Finishing Company, one of which is "one of the most important patents on that machine" (Defs.' Ex. 275, R. Vol. 5, p. 766).

Mr. Winslow testified:—

> "This property was acquired at the earnest solicitation of George W. Emerson, who was interested in a trout farm on Cape Cod and desired to retire from the shoe machinery business. . . . The amount paid was based upon the inventory of the Emerson Company" (R. Vol. 1, p. 459, lines 35–40).

Since this acquisition the business of the Emerson concern has been continued by the United Company in its several departments and the machines acquired have all been supplied to customers (R. Vol. 1, p. 59, lines 12–13; p. 94, lines 37–38; p. 95, lines 1–3, 9–11). The tip scourer and power spring heel scarfer were both sold outright through the General Department. The heel burnishing machine was taken over by the United Xpedite Company (R. Vol. 1, p. 12, line 37 *et seq.;* p. 94, lines 37–38; p. 95, lines 1–3, 10–11).

Mr. Sampson was for several years the head of the General Department and was then promoted to the executive offices (R. Vol. 1, p. 95, lines 12–17).

W. W. Cross & Company, Incorporated.

This transaction took place February 18, 1903 (P.'s Ex. 103, R. Vol. 4, p. 744). This corporation was formed to take over the business owned by W. B. Cross, including his real estate and factory (Defs.' Ex. 231, R. Vol. 5, p. 463). He did not manufacture shoe machinery, but nails and tacks for use in the manufacture of shoes (R. Vol. 1, p. 60, lines 1–2).

The United Company was not engaged in the manufacture of nails and tacks (R. Vol. 1, p. 60, lines 3–5). The Consolidated & McKay Lasting Machine Company had obtained from Cross substantially all of its tacks, "many tons every week," these tacks being made particularly for the lasting machines put out by the Consolidated & McKay Company; and the United Company, in continuing to put out those machines, obtained its tacks from the same source (R. Vol. 1, p. 93, lines 31–38; Defs.' Ex. 231, R. Vol. 5, p. 463).

Mr. Cross was very closely associated with the United Company, which was the only large customer that he had and which took nearly his entire output (R. Vol. 1, p. 462, lines 28–34; p. 93, lines 35–36). The demand for tacks by the customers of the United Company grew to such proportions that it became a problem how to obtain a sufficient supply (R. Vol. 1, p. 672, lines 6–12), since Mr. Cross was not willing, without some assurance as to the future, to put up the capital necessary for such an enlargement of his output for the accommodation of a single customer (R. Vol. 1, p. 462, lines 30–32).

> "We simply acquired that business to be able to supply our lasting machine customers with tacks" (Howard, R. Vol. 1, p. 93, lines 36–38).

The agreement (P.'s Ex. 103, R. Vol. 4, p. 744) was entered into "for the purpose of enabling the Cross Company to extend their business and fix permanently the relations between the company and W. B. Cross" (Winslow, Defs.' Ex. 231, R. Vol. 5, p. 463).

Since the acquisition the United Company has continued to buy its tacks from W. W. Cross & Company, Inc., and the business has so increased that it now employs 317 men; it then employed about forty men (R. Vol. 1, p. 462, lines 33–34). However, that company by no means occupies this field exclusively. The Atlas Tack Company, in which the United Company has no interest, "is the largest manufacturer of tacks in this country" (Winslow, R. Vol. 1, p. 472, lines 39–41).

J. K. Krieg & Company.

This transaction took place May 6, 1903 (P.'s Ex. 104, R. Vol. 4, p. 746). J. K. Krieg & Company was a copartnership doing business in New York. They owned no real estate and had a small machine shop above their store where they employed four men and one boy, who were engaged principally in rebuilding old machines and repairing machines used in other lines of manufacturing, but who when not so engaged were employed in building the few machines, of General Department types, which Krieg put out (Defs.' Ex. 231, R. Vol. 5, p. 452).

Krieg had been local agent for the United Company and its predecessors for parts and supplies for all the machines except the Goodyear machines, and the Krieg store was the headquarters for the United Company's men. J. K. Krieg had died and his business was being carried on by his estate. Mr. Winslow testified,—

> "We dealt with that situation in this way: We acquired that part of the J. K. Krieg business, which related directly to the business that was done with shoe manufacturers. The younger Krieg retained the business that had to do with retailers" (R. Vol. 1, p. 419, lines 39–42).

One of the three machines which Krieg put out was a patented heel seat rounding machine especially constructed for rounding heel seats of Goodyear shoes. The only machine the United Company had for this operation was an edge-trimming machine provided with a larger cutter than was used for edge-trimming. This edge trimming machine effected

the trimming operation by chewing up the surplus stock into dust while the Krieg machine cut off the surplus stock so that the scraps cut off could be sold or utilized either for scrap leather or for manufacturing pieced heels, thus effecting a substantial and therefore important economy. The United Company "had no machine of that kind before" (R. Vol. 1, p. 60, lines 28–34; p. 92, lines 31–45; p. 93, lines 1–10; Vol. 2, p. 2045, Ints. 1446–1448).

Krieg also had manufactured by other parties and was putting out a Louis heel scarfing machine for cutting from the grain side of the outsole a strip of leather to be bent up over the undercut breast surface of a Louis heel, a wood heel, used in a particular type of woman's shoe. The United Company had no machine capable of performing the operation of that machine. Krieg also had an embossing machine for stamping names or trademarks on upper linings (R. Vol. 1, p. 60, lines 35–41; p. 93, lines 11–28).

By this transaction the United Company acquired machines which it did not have before and was thus extending its line.

But the more important reason for this acquisition had to do with the desire of the United Company to establish its own headquarters for its local repair men in the New York district and to take under its own control the carrying and supplying of spare parts for its machines to manufacturers in the New York district just as it had previously done in other parts of the country by the acquisition of the Ross-Moyer Manufacturing Company and The George A. Smith Machinery Company. The importance of this policy, both to the United Company and to the trade, and the general reasons why the United Company in establishing its own agencies acquired the properties of the concerns which had previously been its agents are fully explained in the discussion of the acquisition of the Ross-Moyer Manufacturing Company (*supra*, pp. 680–683).

Mr. Winslow testified,—

> "In all of these cases the moving motive in making these arrangements was from Mr. Ross in the Ross-Moyer and Smith, and representatives of the Krieg estate, who wanted

in the rearrangement to make the best arrangements for themselves" (R. Vol. 1, p. 419, lines 42–44; p. 420, lines 1–2).

The amount paid for this business was $97,056.52 (Def's. Ex. 231, R. Vol. 5, p. 451), which was the inventory value of the property "less proper deductions therefrom" for depreciation and for unsalable goods (P.'s Ex. 104, R. Vol. 4, p. 749).

After this acquisition the United Company used the Krieg store in New York as headquarters of its repair force, furnishing "very much better service," and kept there a complete line of parts and supplies for all its machines. The United Company also continued putting out the new machines which it had acquired from J. K. Krieg & Company (R. Vol. 1, p. 95, lines 30–35; p. 60, lines 32–34; p. 93, lines 19–21, 29–30).

Joseph P. Curtis.

By this transaction, which took place Oct. 20, 1903, the United Company acquired certain patent rights and nothing more. Curtis assigned two pending applications to the United Company. Curtis did not transfer his one experimental machine (P.'s Ex. 106, R. Vol. 4, p. 754; R. Vol. 1, p. 92, lines 21–22). These patent rights related to a machine for cementing a piece of fabric to an upper. The United Company had no machine for use in performing this operation nor any machine that could be used for this work, "which required a machine of an entirely different type and entirely different organization from any we had."

On the other hand, the Curtis machine could not be used for the same purpose as any machine of the United Company (R. Vol. 1, p. 61, lines 10–18; p. 92, lines 4–12).

The consideration in this transaction was "$500 cash and a royalty of $10 on each machine embodying the inventions" (Winslow, Defs.' Ex. 231, R. Vol. 5, p. 468).

The United Company subsequently obtained Letters Patent upon an application filed by Curtis and did all that it could to make the machine a commercial success, putting out in all about forty-five machines constructed according to that patent. The machines, however, did not prove to be a practical success, since the operation performed was not satisfactory. Most

of the machines which were put out were returned (R. Vol. 1, p. 92, lines 13–20; Vol. 2, p. 2045, Int. 1445). Moreover, "the Peerless Machine Company, under patents owned by them, were able to produce a better machine and have done the larger part of this business" (Winslow, Defs.' Ex. 231, R. Vol. 5, pp. 468, 469).

Fred H. Perry.

The agreement with Fred H. Perry, which was merely an employment contract, was made January 1, 1904 (P.'s Ex. 107, R. Vol. 4, p. 758). No property of any kind was acquired from Mr. Perry. He had entered the employment of the company as a machinist, at wages of thirty-four cents an hour, less than four years before the date of the contract referred to in the petition. He was given the opportunity in 1903 "at his own urgent request" to enter the inventive department of the company and demonstrate whatever inventive ability he might possess, and was paid $30 a week for the first eighteen months of this employment. Mr. Perry developed into a "very successful inventor," and has made some very important inventions for the company. He is still employed by the company and his salary has been materially increased several times, and on January 1, 1911, was raised to $4,000 a year. The important inventions that he has made have been embodied in commercial machines which have been given immediately to the trade and have been put out in large numbers. Among these machines are the present commercial Rounding and Channeling Machine—Model E: Goodyear Universal, and Jointing Machine: Goodyear, the importance and value of which are explained in detail by Mr. Howard (R. Vol. 1, p. 91, lines 18–40; Vol. 2, pp. 2309 *et seq.*, 2611 *et seq.*; Defs.' Ex. 231, R. Vol. 5, p. 473).

Joseph W. Leary.

The agreement with Joseph W. Leary made January 1, 1904, was primarily an employment contract (P.'s Ex. 109, R. Vol. 4, p. 769). The very small business which he was doing

was insignificant. He did no manufacturing of any kind, employed no men, and had no factory. He was engaged principally in retailing, in a small way, cements and blackings such as are used in the manufacture of shoes and are supplied by "hundreds of dealers." He also dealt in a very small way in second-hand sewing machines for sewing together the parts of an upper before the bottoming room operations, but dealt in no new machines except the Amazeen machine which he sold for the United Company (R. Vol. 1, p. 62, lines 1–11; p. 91, lines 1–8; Defs.' Ex. 231, R. Vol. 5, p. 473).

In connection with his small local sale business in Lynn, Leary was an agent for the Amazeen skiving machine which was being put out by the United Company. "He was an extremely capable salesman and mechanic, thoroughly familiar with the Amazeen machine, and unusually successful in selling it." His activities with reference to the machine were, however, in view of the local character of his business, entirely centered in Lynn, and the principal reason for entering into the contract of employment with him was to obtain his services in selling the machine in a much wider field (Howard, R. Vol. 1, p. 91, lines 9–17; Defs.' Ex. 231, R. Vol. 5, p. 474).

> "Mr. Leary stated that he would like to enter the employ of the United Company if the company would buy his stock of cement and second-hand machinery, and the company paid him $3052 for the small stock that he had on hand" (Winslow, Defs.' Ex. 231, R. Vol. 5, p. 474).

Leary is still employed by the United Company as an agent for the Amazeen machine (R. Vol. 1, p. 91, lines 16–17).

The F. G. Farnham Brush Manufacturing Co.

This transaction took place January 23, 1904 (P.'s Ex. 109, R. Vol. 4, p. 769). The Farnham Company was a small concern employing only six men. It leased floor space in a small factory in Honesdale, Pa. Almost its entire business was in putting out patented Tampico brushes for the cut glass trade, but it also put out a few patented brushes for the shoe trade and it put out the sleeves, collars, hubs and fillers that

are necessary parts of such brushes. Brushes are used in the shoe trade for cleaning and polishing only (R. Vol. 1, p. 62, lines 30–44; p. 89, lines 42–44; p. 90, lines 1–9, 36–39; R. Vol. 2, p. 2045, Int. 1444; Defs.' Ex. 231, R. Vol. 5, p. 464).

The United Company was putting out shoe brushes, sleeves, hubs and collars that it obtained from S. A. Felton & Son Company, in which the United Company has a half interest, but the United Company did no business in Tampico brushes (R. Vol. 1, p. 62, lines 34–36; Defs.' Ex. 231, R. Vol. 5, p. 462).

The important reason for this purchase was that the Farnham brush was much superior to the Felton brush.

> "The Farnham brush was very superior to our old brush, the Felton brush, with which we had been having great difficulty because the bristles were constantly coming out. For several years we had been having complaints all the time that the bristles would not stay in the brush. In this respect the Farnham brush was much superior to our old brush" (Howard, R. Vol. 1, p. 90, lines 15–20).

The Farnham Company had patents on its brush, brush section and a combined brush and hub; and the United Company wished to obtain these patents in order to furnish a better brush to the shoe trade (R. Vol. 1, p. 90, lines 36–39; Defs.' Ex. 231, R. Vol. 5, p. 464).

The Farnham Company was poorly located geographically for dealing with the shoe trade and desired to sell out; the purchase was made "at the earnest solicitation of the officials of the Farnham Company" for $25,915.32 (R. Vol. 1, p. 90, lines 7–9; Winslow, Defs.' Ex. 231, R. Vol. 5, p. 464).

After the purchase, the Farnham "business was continued at Honesdale for nearly a year and was then removed to the factory of S. A. Felton & Son Company, where the business has been continued." The business in brushes for the cut glass trade was continued and is still being carried on. The Farnham shoe brushes were supplied in considerable quantities for a time on account of its superiority to the old brush, "but it was more expensive, so that the demand for it has not been as great as it otherwise would have been" (Howard, R. Vol. 1, p. 90, lines 10–22; Defs.' Ex. 231, R. Vol. 5, p. 464). Mr. Howard testified:—

"After we acquired the Farnham brush we made use of the general idea of the Farnham brush and produced an improved brush of this same general type, with the addition of valuable improvements which completely overcame the difficulties which we had had before. . . . That construction afforded a complete solution of the difficulty which had been troubling us for several years." (R. Vol. 1, p. 90, lines 23–31).

This improved brush, which is very satisfactory, is the one the United Company is now principally putting out (R. Vol. 1, p. 90, lines 39–45).

American Glue Company.

This transaction was merely a contract entered into May 2, 1904 (P.'s Ex. 110, R. Vol. 4, p. 796) for the exclusive agency for the American Glue Company's sandpaper in the shoe trade:

"The American Glue Company transaction was merely a contract, terminable on three months' notice, relating to sand-paper in the shoe trade—not in other trades" (Winslow, R. Vol. 1, p. 462, lines 39–41).

"It is agreed, however, that either party shall have the right to terminate this agreement by a three months' notice in writing delivered to the other of said parties, and in case such notice shall be given, then this agreement shall, at the end of the said three months, terminate" (P.'s Ex. 110, R. Vol. 4, p. 798).

As stated by Mr. Winslow (R. Vol. 1, p. 472, lines 30–33):

"The American Glue Company wanted us to take over their molded sandpaper business, which is a part that especially applies to shoe making and does not include their entire business;"

but the United Company took only an agency for the United States and Canada such as it already had abroad, and "The United Company has no interest whatever in the American Glue Company" (Winslow, Defs.' Ex. 231, R. Vol. 5, p. 464; Howard, R. Vol. 1, p. 89, lines 35–36).

"The United Company made no goods of a similar character, but has marketed a large amount of goods for the American Glue Company under this contract" (Winslow, Defs.' Ex. 231, R. Vol. 5, p. 464).

"Sandpaper is used in the manufacture of shoes for the operations known as scouring and buffing. The general object of each operation is the same—to smooth up the particular part of the shoe on which the operation takes place.

"Prior to this agreement the United Company was agent for the American Glue Company abroad, and it had bought from the American Glue Company the sandpaper which it furnished to customers in this country. This agreement did not change the trade relations of the parties in the least. After making the agreement the United Company continued to furnish the same sandpaper to customers as liberally as before" (Howard, R. Vol. 1, p. 89, lines 31–41).

Zachary Taylor French.

This transaction took place January 1, 1904 (P.'s Ex. 111, R. Vol. 4, p. 803). Zachary Taylor French owned no real estate and no manufacturing plant was acquired. Contrary to the allegation in the petition (R. Vol. 1, p. 1014), "French had no business of his own, but had been for thirty years in the employ of the Goodyear Company, or its predecessors" (Winslow, Defs.' Ex. 231, R. Vol. 5, p. 471).

This transaction was thus explained by Mr. Howard:—

"Mr. French had for a great many years been in the employ of the United Company and its predecessor, the Goodyear Company, as an inventor, and later as superintendent of the Goodyear factory on Albany Street in Boston. His inventions were covered by a number of royalty agreements. He did not wish to move to Beverly when the plant there was opened about this time, and therefore desired to leave the employ of the company. A settlement was made of the royalties which would become due under his various contracts; and the agreement of plaintiff's Exhibit 111 incorporates the settlement which was made at that time" (R. Vol. 1, p. 63, lines 30–40).

"It had been the practice of the Goodyear Company to make royalty agreements with him from time to time which provided for payments for his inventions by way of royalties" (R. Vol. 1, p. 89, lines 25–27).

Mr. Winslow testified that the agreement was made—

> "to commute obligations existing prior to 1899 under royalty contracts for the right to manufacture under patents" (R. Vol. 1, p. 464, lines 9–14).
>
> "Reason for agreement to assign future inventions and not to compete with the United Company for ten years, was because French desired to leave the company's employ and to have his royalty contracts (which were entirely dependent upon the number of machines that might be put out) placed upon a definite basis of annual payment" (Defs.' Ex. 231, R. Vol. 5, p. 471).

The consideration was the United Company's agreement to pay $15,000 in annual instalments of $1500 each (P.'s Ex. 111, R. Vol. 4, p. 810).

Kimball and Hadley.

This transaction took place June 11, 1904 (P.'s Ex. 112, R. Vol. 4, p. 814). Kimball and Hadley were a copartnership. They leased small floor space in Lynn and employed two men and two boys. Their principal business was the manufacture of Goodyear needles, *i.e.*, the curved needles used on Goodyear welters and stitchers (R. Vol. 1, p. 64, lines 10–12; Defs.' Ex. 231, R. Vol. 5, p. 464).

The United Company was not making Goodyear needles (R. Vol. 1, p. 64, lines 15–16). Hadley, a witness for the United States, testified to the same effect:—

> "They obtained their Goodyear needles from the Smith Company in New Haven, Connecticut, and from the Excelsior Needle Company, of Torrington, Connecticut.
>
> "*Q.* But so far as you know they didn't make any of their own?
>
> "*A.* No. . . .
>
> "*Q.* You just told me they didn't manufacture any Goodyear needles.
>
> "*A.* They didn't" (R. Vol. 1, p. 310, lines 33–37; p. 311, lines 5–7).

By this acquisition the United Company was merely extending its field to include the manufacture of Goodyear needles. The United Company has continued to manufact-

ure Goodyear needles and to supply them at the same prices that had been charged by Kimball and Hadley (R. Vol. 1, p. 64, lines 21–22; Defs.' Ex. 231, R. Vol. 5, p. 465).

That this transaction was entirely negligible is proved by Mr. Hadley's testimony to the effect that at least two other concerns were engaged in the business of making Goodyear needles, by the size of the concern as above indicated, and by the amounts of the purchase price, $4750, and Hadley's original asking price, $5000 (Hadley, R. Vol. 1, p. 310, lines 33–35; p. 311, lines 13–14).

After this transaction Kimball and Hadley again engaged in the needle business despite their covenant to keep out of that business for fifteen years (P.'s Ex. 112, R. Vol. 4, p. 815), and in a suit to enforce the terms of their agreement with the United Company they were enjoined from continuing the business (Hadley, R. Vol. 1, p. 311, lines 15–20). The decision of the Supreme Court of Massachusetts affirming the granting of this injunction is reported in 193 Mass. 351. (See also *infra*, pp. 767–770.)

Arnold Machine & Supply Company (William B. Arnold).

This transaction took place June 28, 1904 (P.'s Ex. 113, R. Vol. 4, p. 816). The Arnold Machine & Supply Company was engaged in manufacturing a patented machine for applying cement to an insole for the purpose of securing a reinforcing strip of canvas to it in the process of making what is known as the Gem insole, of which Defendants' Exhibit 17 is a sample. The Arnold Company had put out only seven machines. This machine and two patents were all that was acquired by this transaction and the consideration was "$500 and royalties to be paid on machines when put out" (R. Vol. 1, p. 64, lines 39–46; p. 88, lines 20–30; Winslow, Defs.' Ex. 231, R. Vol. 5, p. 469).

"It had never been the practice before this machine was invented to apply cement to the insole rather than to the canvas." The United Company had no machine which could possibly be used for performing the operation of the Arnold machine which had to be specially constructed for the purpose

for which it was intended. "What had been used before was not a cementing machine; it was merely a cement pot through which the canvas was drawn on its way to the table, where it was cut off and applied to a piece of leather" (Howard, R. Vol. 1, p. 64, line 46; p. 65, lines 1–14; p. 92, lines 7–12).

The Arnold machine was a very satisfactory one; but immediately after the purchase by the United Company demand for the machine entirely ceased for the reason that the process of preparing the Gem insole was entirely revolutionized by the production of—

> "a new type of reinforcing canvas which was introduced about this time by concerns other than the United Company. That canvas was sold to manufacturers with the cement already on it, and it was steamed and heated and then stuck right on the sole. There were three concerns engaged in preparing and selling this new type of reinforcing canvas and it entirely revolutionized the prior processes of making Gem insoles. This new process was subsequently used instead of the cementing machine and entirely superseded it" (Howard, R. Vol. 1, p. 88, lines 31–43).

Leopold J. Courteau.

This transaction took place October 1, 1904 (P.'s Ex. 115, R. Vol. 4, p. 826). The United Company acquired from Leopold J. Courteau an invention; nothing more. As shown by the agreement, it did not even acquire title to the experimental machine in which Courteau had embodied his invention. The consideration was an agreement "to pay royalty of 10 per cent of the selling price until $1000 had been paid," and this agreement was conditional upon the United Company obtaining Letters Patent of the United States if its patent solicitors were of the opinion that such patent "can be obtained giving any substantial protection" (R. Vol. 1, p. 87, lines 35–37; Winslow, Defs.' Ex. 231, R. Vol. 5, p. 469; P.'s Ex. 115, R. Vol. 4, p. 827).

The object of this invention was "a mechanism for holding the linings of shoes during the process of pasting the outer [upper] leather to the lining." This cementing operation is performed to a limited extent on some kinds of shoes, and the

work had previously been done by hand. The United Company had no machine for performing this operation (R. Vol. 1, p. 66, lines 10–12; p. 87, lines 30–37; R. Vol. 4, p. 826).

An application for United States patent upon Courteau's invention was filed, and a patent was subsequently issued upon this application (R. Vol. 1, p. 87, lines 35–37; R. Vol. 2, p. 2043, Int. 1438).

The United Company was entirely unable to produce a practicable machine embodying the Courteau invention. Mr. Howard testified,—

> "Nothing ever came of this agreement. We were unable after the most strenuous efforts to make a practicable machine. During our experiments Courteau was often consulted and finally confessed himself that he saw no way to make the machine practicable" (R. Vol. 1, p. 66, lines 12–16).

And again,—

> "We made a very determined effort to make it practicable. Our inventors who were working upon it had frequent conferences with Courteau, and finally, when they were convinced that it was utterly impracticable, they made a final appeal to Courteau to see whether he could make any suggestions which would remedy the situation, and he was unable to do so. The concern with which Courteau was connected, which under the agreement was entitled to have machines at cost [see P.'s Ex. 115, R. Vol. 4, p. 829], considered the machines worthless and refused to take any machines. We did the best we could with it but could not develop anything out of it, and it was given up" (R. Vol. 1, p. 87, lines 39–45; p. 88, lines 1–4).

Booth Brothers (1904 Agreement).

By this transaction, which took place October 25, 1904, the United Company acquired a vamp-perforating machine referred to in the agreement of Plaintiff's Exhibit 114 (R. Vol. 4, p. 822) as "the experimental machine," and the patent on that machine; it acquired no plant or shop (R. Vol. 1, p. 88, lines 5–6; Defs.' Ex. 231, R. Vol. 5, p. 469).

The consideration in this transaction was $2,400 in cash and $7,600 to be paid in royalties (Defs.' Ex. 231, R. Vol. 5, p. 469; P.'s Ex. 114, R. Vol. 4, p. 823).

The Booth machine was designed for ornamenting uppers or parts of uppers. The United Company had no vamp-perforating machine nor any machine which could be used for perforating vamps (R. Vol. 1, p. 65, lines 31–42; p. 88, lines 6–16; R. Vol. 2, p. 2044, Int. 1439; Defs.' Ex. 231, R. Vol. 5, p. 469).

The acquisition of this patent enabled the United Company to extend its line to include a vamp-perforating machine.

This machine has been sold by the United Company through its General Department in large numbers and the business in it was very largely developed after the United Company acquired it (R. Vol. 1, p. 88, lines 17–20).

Brockton Supply Company.

As shown by Plaintiff's Exhibit 116 (R. Vol. 4, p. 831), by this transaction, which took place November 1, 1905, the United Company acquired from the Brockton Supply Company, a copartnership, two patents covering a machine for pulling lasting tacks. At this time the United Company had no commercial tack-pulling machine; "it was developing one, but had put none out" (Howard, R. Vol. 1, p. 66, lines 24–26; p. 87, lines 3–6, 25).

The United Company's experimental machine infringed two claims of one of the patents owned by the Brockton Supply Company. On the other hand, the Brockton Company's machine infringed seven claims of two applications owned by the United Company (R. Vol. 1, p. 66, lines 26–27; p. 87, lines 25–27; R. Vol. 2, p. 2043, Ints. 1436, 1437; Defs.' Ex. 275, R. Vol. 5, p. 767).

This situation created a patent deadlock which was removed by common ownership of the two groups of patents. Furthermore, the firm members of the Brockton Supply Company had had a serious disagreement and desired to liquidate their business. Also Mr. Campbell, one of the partners, was anxious to go out of business. They had already sold a part

of their business to another concern, and "Campbell had suggested to Nichols that he (Nichols) see if they could not sell the rest of their business to the United Company, which Nichols did," and the United Company was willing to make this acquisition, as it "had not been able up to that time to produce a tack-pulling machine" (Winslow, Defs.' Ex. 231, R. Vol. 5, p. 477; Howard, R. Vol. 1, p. 66, lines 28–29).

After this acquisition the United Company put out to a considerable extent the machine acquired from the Brockton Supply Company, but Mr. Howard testified that—

> "the most important use which we made of the inventions was to incorporate them in our experimental tack pulling and resetting machine, particularly the feature covered by claims of those patents which that machine had infringed. That machine was for use on Goodyear shoes and not only pulled the lasting tacks but drove the lighter tacks, called slivers, which hold the upper in place until after the welt has been sewed on. . . . Previously it had always been the practice to drive those slivers by hand. This new tack pulling and resetting machine of ours, in which we incorporated the inventions claimed in the patents acquired from the Brockton Supply Company, was the first machine in the art for performing the two operations at once. . . . After the acquisition we combined their inventions and ours in our machine and furnished it to customers in large numbers" (R. Vol. 1, p. 87, lines 8–15, 19–24, 27–29).

Smith Lacing Machine Company.

This transaction took place January 31, 1906 (P.'s Exs. 117, 118, R. Vol. 4, pp. 834, 840). The Smith Lacing Machine Company owned no real estate and did no manufacturing (Defs.' Ex. 231, R. Vol. 5, p. 477).

The Smith Company had produced an entirely new machine for lacing uppers.

> "The lacing machine is a wonderful machine, embodying a large number of patented inventions for automatically lacing and tying the opposed eyelets, of a shoe upper, preparatory to the lasting operation, for the purpose of

maintaining the edges at just the right distance apart during the lasting and subsequent operations. . . .

"Prior to this the practice had been for girls to insert strings through the eyelets and tie the ends of the string. This was handwork. . . . The United Company had no machine for performing this operation or for the purpose of holding together the tops of the uppers of shoes" (Howard, R. Vol. 1, p. 67, lines 3–8, 13–15, 18–20; p. 86, lines 25–30).

This machine "was not really on a commercial basis" and the Smith Company "had placed none upon the market" (Howard, R. Vol. 1, p. 86, lines 31–32; Winslow, Defs.' Ex. 231, R. Vol. 5, p. 477).

The Smith machine infringed many allowed claims in a pending application owned by the United Company. The machine of that application, however, "was only experimental, and was never used commercially" for reasons explained by Mr. Howard (R. Vol. 2, p. 2601 *et seq.*).

On the other hand, the essential organization for a successful lacing machine was—

"broadly covered by the claims of a patent owned by the Smith Company, which also owned other patents containing broad claims to many features of the machine which were found indispensable for a commercially successful machine.

"This situation resulted in a deadlock since neither the United Company nor the Smith Lacing Company was able to put out a commercial lacing machine without infringing a patent or patents owned by the other" (Howard, Defs.' Ex. 275, R. Vol. 5, pp. 767, 768).

Mr. Winslow testified that after the acquisition "we developed the lacing machine, till to-day it is used in pretty nearly every factory where they manufacture lace shoes" (R. Vol. 1, p. 463, lines 13–15).

"The Smith Company had intended to charge an initial payment and royalty for the use of the machine. The United Company furnished these machines to their customers without initial payment and at one-half the royalty that the Smith Company had intended to charge" (Winslow, Defs.' Ex. 231, R. Vol. 5, p. 478).

Up to March 1, 1913, the United Company had put out 1415 lacing machines. One of these machines will take care of as many shoes as from four to seven welt-sewing machines (R. Vol. 2, p. 2605, Int. 112).

The consideration in this transaction was a payment of $50,000 in cash and $67,500 to be paid in royalties. "This payment was completed within three years" (Winslow, Defs.' Ex. 231, R. Vol. 5, p. 477).

Metallic Heel and Counter Company.

This transaction took place January 31, 1906 (P.'s Ex. 119, R. Vol. 4, p. 843). The Metallic Heel and Counter Company owned no real estate, leased floor space, employed about seventy men, and manufactured metallic heels and counters (Defs.' Ex. 231, R. Vol. 5, p. 465).

> "The United Company acquired from the Metallic Heel and Counter Company patented machines used in the manufacture of a patented metallic heel and counter. This was used on very heavy shoes worn by miners, quarrymen, and others engaged in work of that character" (Howard, R. Vol. 1, p. 67, lines 30–34; p. 86, lines 38–44); (a shoe with metallic heel and counter is Defendants' Exhibit 20).
>
> "The Metallic Heel & Counter Company manufactured patented metallic heels and counters to go outside of shoes for miners' work or heavy outdoor work of that sort" (Winslow, R. Vol. 1, p. 462, lines 44–45; p. 463, line 1).

The United Company did not manufacture any metallic heels and counters and had no machinery that could be used for that purpose (R. Vol. 1, p. 67, lines 36–39; Defs.' Ex. 231, R. Vol. 5, p. 465).

Important reasons for this acquisition were the following:—

(1) The United Company extended its business by entering a new field.

(2) "A very substantial reason for acquiring this company and the Smith Lacing Machine Company was to secure

the undivided services of George Warren, J. B. Hadaway, and William Gordon, who were already in the employ of the United Company in other matters. Messrs. Warren and Hadaway are members of the United Company's Experimental Committee" (Winslow, Defs.' Ex. 231, R. Vol. 5, p. 465).

"The men who were interested in that company,—particularly two of them,—were men whom we used in our own business and consulted as experts. One of them was Mr. Warren" (Winslow, R. Vol. 1, p. 463, lines 3–6).

Mr. Warren, a mechanical engineer, one of defendants' expert witnesses in this suit, has been engaged in "designing and overseeing the manufacture of shoe machinery" for the United Company (Warren, R. Vol. 1, p. 785, lines 7–10).

(3) "The parties interested in the Smith Lacing Machine Company and the Metallic Heel & Counter Company were the same. We had to buy them both in order to get either" (Howard, R. Vol. 1, p. 86, lines 35–37).

"When we acquired that machine they wanted us to take over their whole enterprise, including the Heel & Counter Company, which was really the machine shop" (Winslow, R. Vol. 1, p. 463, lines 9–11).

"It was impossible to purchase the Smith Lacing Machine Company without acquiring this business" (Winslow, Defs.' Ex. 231, R. Vol. 5, p. 465).

Since the acquisition the United Company has supplied to the trade the metallic heel and counter in very considerable quantities and has a separate department at Beverly for manufacturing them, which is busy all the time (R. Vol. 1, p. 86, lines 44–45; p. 87, lines 1–2).

The consideration for this acquisition was $52,320.24 in cash and $67,500 in royalties payable on account of the lacing machine acquired from the Smith Lacing Machine Company; that is, the payment of more than half the consideration depended upon the commercial success of the Smith Lacing Machine (Defs.' Ex. 231, R. Vol. 5, p. 465; P.'s Ex. 119, R. Vol. 4, p. 845).

Zotique Beaudry.

This transaction took place September 4, 1906 (P.'s Ex. 120, R. Vol. 4, p. 850). Beaudry, as a witness for the United States, testified: "I am in the shoe machinery business, inventing and manufacturing." Mr. Winslow testified: "Beaudry was and is today a manufacturer of edge setters" (R. Vol. 1, p. 328, lines 42–43; p. 473, lines 3–4). That business was not acquired.

By this transaction the United Company acquired an "experimental heel-burnishing machine, which had not been even tried out in any shoe factory," and the patents on that machine, and no other property whatever. The patents were acquired on account of and were assigned to the United-Xpedite Finishing Company, a majority of the capital stock of which is owned by the United Company (Howard, Defs.' Ex. 275, R. Vol. 5, p. 768; R. Vol. 1, p. 68, lines 7–9; p. 86, lines 16–21).

> "At this time the United-Xpedite Company had a heel burnishing machine, but the Beaudry inventions covered appliances which could be added to the Xpedite machines corresponding to which the Xpedite Company had nothing at all. The Beaudry inventions, covered by several patent applications, embodied an entirely new idea" (Howard, R. Vol. 1, p. 68, lines 9–14).

Mr. Winslow stated: "that it was believed at the time that it would enable the United-Xpedite Company to improve its machines very materially. Beaudry had been the original inventor of the machine put out by the Xpedite Company" (Defs.' Ex. 231, R. Vol. 5, p. 469; Beaudry, R. Vol. 1, p. 329, lines 1–3).

Litigation was avoided by this acquisition. Beaudry's experimental machine infringed nine claims of a patent owned by the United-Xpedite Finishing Company (Defs.' Ex. 275, R. Vol. 5, p. 768).

Mr. Howard testified: "At the time we acquired the invention we thought very highly of it, as evidenced by the price that we paid for it" (R. Vol. 1, p. 86, lines 1–2). The consideration was $12,500 (Defs.' Ex. 231, R. Vol. 5, p. 469).

Mr. Howard testified that after the acquisition:—

> "We constructed several experimental machines. . . . We tried in all sorts of ways to make it practicable, but the extreme inconvenience to which the operator would be put by a machine so organized finally condemned it as entirely impracticable" (R. Vol. 1, p. 86, lines 2–15).

Mr. Winslow stated: "As a result of a great many experiments made after the purchase of the patents, this money was wasted" (Defs.' Ex. 231, R. Vol. 5, p. 469).

Booth Brothers (entire business).

This transaction took place November 1, 1907 (P.'s Exs. 121–124, R. Vol. 4, pp. 856, 861, 862, 867). This concern was "a partnership composed of Quentin W. Booth and Irving E. Booth. They owned no real estate but leased floor space in Rochester, New York, and employed about twenty-two men. The purchase was made in 1907 for $71,284.20" (Winslow, R. Vol. 1, p. 460, lines 21–25).

At this time Booth Brothers were putting out patented machines of four types (R. Vol. 1, p. 68, lines 35–45; p. 69, lines 1–8; p. 84, lines 12–15; p. 85, lines 1–27; R. Vol. 2, p. 2519, Int. 96). One of these machines was the patented impression stitch-burnishing machine for burnishing impression stitches on the upper face of the welt of a welt shoe. This machine was much superior to the machine which the United Company was attempting to use for the same work, but it infringed claims in a pending patent application owned by the United Company on which a patent was subsequently granted. The United Company's machine was not successful and after this transaction the United Company substituted the Booth machine for that work (R. Vol. 1, p. 85, lines 1–14; Defs.' Ex. 275, R. Vol. 5, p. 766).

Another Booth patented machine was a fudge edge making machine for making imitation stitches on the upper face of the sole edge and simultaneously setting or burnishing the edge of the sole. The United Company had no machine for doing the work of this machine (R. Vol. 1, p. 84, lines 12–23).

Booth Brothers were also putting out patented upper beading machines for beating down the seams after parts of uppers have been sewed together. These were better machines than the United Company's machine, which was satisfactory only on heavy work, and the United Company as agents had sold many of the Booth machines, which were much better on light work (R. Vol. 1, p. 69, lines 12–13; p. 84, lines 35–45; Defs.' Ex. 231, R. Vol. 5, p. 457).

They also had two types of wheeling machines which were used to define the imitation stitch on the upper face of a welt shoe preparatory to the stitch burnishing operation. Both of these machines infringed the United Company's patents. The United Company's wheeling machine was adapted for use only on McKay shoes, while the Booth machines, as stated, were used on welt shoes (R. Vol. 1, p. 84, lines 24–34; Defs.' Ex. 275, R. Vol. 5, p. 765).

Booth Brothers were also putting out "a simple contrivance, really a support for the shoe" known as an "Upper Shaping Machine" for holding the uppers of cloth-topped shoes while they were being cleaned. There was a small demand for it, and the United Company had nothing of the kind (Howard, R. Vol. 1, p. 85, lines 15–21; p. 69, lines 13–14).

The reasons for this acquisition were as follows:—

(1) As above explained, the United Company had either no machines or inferior machines for performing the operations of the Booth Brothers' machines and the Booth Brothers' machines were patented.

> "The Company felt that it could add these particular machines to its line of machines to advantage to its customers and to itself, as an ordinary business transaction; and also utilize the services of Irving E. Booth, who was a very capable man in that line of endeavor" (Winslow, R. Vol. 1, p. 460, lines 28–32).

(2) This business was acquired at the solicitation of Booth Brothers.

> "The reason given by them for soliciting the United Company to purchase their business was that Quentin W. Booth wished to retire from business and Irving E. Booth did not care to attempt to run the business alone, but did not wish to retire."

The United Company, "were persuaded to make this purchase" (Winslow, Defs.' Ex. 231, R. Vol. 5, p. 457).

(3) Three of the principal machines put out by Booth Brothers infringed claims of a patent and an application owned by the United Company (Defs.' Ex. 275, R. Vol. 5, pp. 766, 767).

After the purchase, a corporation was formed, of which Irving E. Booth was made the manager; the manufacture of the Booth machines was continued at the Booth factory, and through the Booth Company the United Company continued to put out in large numbers the machines which had previously been manufactured by Booth Brothers (R. Vol. 1, p. 85, lines 28–35; p. 460, lines 33–37; Defs.' Ex. 231, R. Vol. 5, p. 457).

Richardson Shoe Machinery Company.

This transaction took place December 1, 1908 (P.'s Ex. 125, R. Vol. 4, p. 871). The Richardson Company "owned no real estate; operated no factory. Contracted with outside parties to build its machines" (Winslow, Defs.' Ex. 231, R. Vol. 5, p. 478). The only machine which the Richardson Company put out was "a greatly improved McKay sewing machine; that is, a McKay sewing machine which had been adapted to do better work with greater speed by their inventions." This machine was patented (Howard, R. Vol. 1, p. 70, lines 6–9; p. 83, lines 5–8).

The United Company was putting out the old McKay sewing machine and also a new one called the Model B in this country, but not abroad. It was putting out the Richardson machine abroad (R. Vol. 1, p. 70, lines 10–15; p. 82, lines 29–33). That old machine was the "original McKay sewing machine which had been developed by Gordon McKay" and which the United Company was rebuilding and selling. Very few old style machines were being manufactured because there were plenty of second-hand ones to be had and the patents on the machine had expired long before (Winslow, R. Vol. 1, p. 564, lines 23–24, 44–45; Howe, p. 680, lines 24–35). Moreover, numerous other concerns supplied McKay sewing machines and in 1909, the year following the acquisition, there were 1488 old style McKay sewing machines in use in the United

States and 308 Model B and Richardson machines, that is, nearly five times as many old machines; so that these two companies had made relatively little impression in this field (R. Vol. 1, p. 565, lines 23–27; p. 977, lines 16–26).

Neither the Richardson nor the Model B machines could possibly be used for sewing welt shoes (R. Vol. 1, p. 83, lines 16–28).

The reasons for this acquisition were as follows:—

(1) The United Company's Model B machine infringed one of the Richardson Company's patents. A claim of one of these patents "clearly covered a very important feature of the Model B machine" (Howard, R. Vol. 1, p. 83, lines 9–13; Defs.' Ex. 275, R. Vol. 5, p. 768).

Mr. Winslow stated:—

> "Although the United Company had endeavored to avoid the infringement of all patents owned by the Richardson Company, this machine still infringed broad claim 16 of patent No. 710,613" (Defs.' Ex. 231, R. Vol. 5, p. 478).

(2) "The work of the Richardson machine was a great deal better." "European manufacturers demanded the Richardson machine and would not have our machine." (Howard, R. Vol. 1, p. 70, lines 12–13; p. 82, lines 35–36).

(3) "It was believed a better machine than either of the two could be constructed by the use of patents owned by both parties" (Winslow, Defs.' Ex. 231, R. Vol. 5, p. 479).

> "We could not develop our machine without combining it with the Richardson machine, and the result of combining the patented inventions of both machines was to produce a better machine than either company alone could develop" (Howard, R. Vol. 1, p. 83, lines 11–15).

(4) John H. Richardson, manager of the Richardson Company, initiated negotiations and stated that "he himself would like to come with the United Company," realizing that with only one machine as a business "the Richardson Company would not be able to make much of a success of its business." Also Mr. Rice, one of the largest stockholders, who is a shoe manufacturer, "wanted to get out of the shoe machinery business entirely" (Winslow, Defs.' Ex. 231, R. Vol. 5, pp. 470, 479).

Since this acquisition the United Company has continued to put out both the Richardson machine and the Model B machine "as desired by the trade" (Winslow, R. Vol. 1, p. 565, lines 20–22, 37; Defs.' Ex. 231, R. Vol. 5, p. 479; Howard, R. Vol. 2, p. 2039, Ints. 1407, 1408.) They are both General Department machines (R. Vol. 5, pp. 430, 437, lines 34, 35).

Further:

> "After the Richardson machine was obtained the United Company immediately put several inventors to work with instructions to combine, each in his own way, the best features of the two machines. The experimenting was carried on very aggressively."

As a result a machine was produced which is "far superior to either the Richardson machine or our Model B machine," and—

> "in its organization and its appearance it more nearly resembles the Richardson machine than it does the Model B. In this new machine many valuable improvements have been made by the United Company's inventors which could not have been embodied in a commercial machine and made available to shoe manufacturers had there not been common ownership of the United Company's patents and the Richardson Company's patents" (Howard, R. Vol. 1, p. 82, lines 39–45; p. 83, lines 1–4; Defs.' Ex. 275, R. Vol. 5, p. 769).

Again, improvements broadly claimed in two of the Richardson Company's patents have been embodied in the United Company's new outsole stitching machine, Lockstitch Machine—Model M: Goodyear Outsole Rapid (Defs.' Ex. 275, R. Vol. 5, p. 768; R. Vol. 2, pp. 2297–2299). Also the improvement of one of those patents has been embodied in the United Company's new Model K welter (R. Vol. 1, p. 83, lines 5–8; Vol. 2, p. 2266).

The petition states that the Richardson Company was "engaged in the manufacture, sale and shipment in interstate commerce of . . . machines known to the trade as 'clicking machines'" (R. Vol. 1, p. 1017). This is a misstatement. The Richardson Company had never made or sold a clicking machine. Through a contract with the Essex Machine Company it had a one-half interest in an experimental clicking machine which was being constructed by that company.

"The machine has never at any time become commercial" and clearly amounts to nothing in this suit, since such interest as the Richardson Company had was not available to enable it to put the machine on the market. "It is controlled by an outside concern." Furthermore, if the machine had been commercial and if the Richardson Company had had such control of it as to be able to put it out, it could not have manufactured or sold this machine without infringing thirty-seven claims of one of the United Company's patents and thirteen claims of two pending applications on which patents were granted subsequently to this acquisition (Howard, R. Vol. 1, p. 70, lines 17–23; Defs.' Ex. 275, R. Vol. 5, p. 769; Winslow, Defs.' Ex. 231, R. Vol. 5, p. 479; P.'s Ex. 125, R. Vol. 4, p. 883).

John H. Richardson.

The agreement with Richardson made December 1, 1908 (P.'s Ex. 126, R. Vol. 4, p. 887) was simply an employment contract. "Richardson had been the general manager of the Richardson Company and was not satisfied with his position." He "had been influential in bringing about the sale of that company to the United" Company and simultaneously with that sale he entered the employ of the United Company (Winslow, Defs.' Ex. 231, R. Vol. 5, p. 474).

Since "Richardson was an inventor having executive ability" he promised to be a very useful and valuable man to the United Company and hence "it seemed proper to safeguard the company" by means of such an employment contract, if the company "expected to gradually promote Mr. Richardson to an important position in its executive forces." In fact, "he is at present in charge of the general department of the United Company and his salary has been repeatedly raised" (Winslow, Defs.' Ex. 231, R. Vol. 5, p. 474).

Carver Cotton Gin Company.

By this transaction which took place April 30, 1908 (P.'s Ex. 127, R. Vol. 4, p. 893) the United Company acquired no real estate or manufacturing plant. The Carver Cotton Gin

Company was engaged in the business of making cotton gins and "the manufacture of any shoe machinery with them was entirely a side line" (Winslow, R. Vol. 1, p. 460, lines 42–43; Defs.' Ex. 231, R. Vol. 5, p. 457).

> "They had got into it accidentally through having manufactured at one time or another machines on contract for parties who did not have shops of their own" (Howard, R. Vol. 1, p. 81, lines 27–29).

Mr. Winslow testified:—

> "As to the Carver Cotton Gin Company, we really got from them some jigs and tools, a small stock of parts, a few machines, all of which were in what is known as the general department" (R. Vol. 1, p. 460, lines 38–40).

These General Department machines which the Carver Company was putting out were the Acme leveling machine, a vamp-skiving machine, a leatherboard skiver, a counter-dividing machine, and a patented machine for finishing the top-lifts of heels known as the "Adams top-piece sanding machine." The United Company had no machines for performing the operations performed by any of these Carver machines (R. Vol. 1, p. 70, lines 32–45; p. 71, lines 1–15; p. 81, lines 30–44; p. 82, lines 1–23).

The Acme leveling machine "is used on freak shoes and samples, where the size and shape change with almost every shoe," because, "after leveling a shoe of one kind, it could take a shoe of an absolutely different size and shape and operate upon it without any adjustment at all."

It was not adapted for regular use on welt shoes "because it is extremely slow as compared with the automatic leveler, and the work which it does is not equal to the work of that machine." It could not be used on either turn or McKay shoes (Howard, R. Vol. 1, p. 70, lines 37–45; p. 81, lines 32–37; R. Vol. 2, p. 2034).

On the other hand, the United Company's machine, "the Goodyear automatic leveling machine, which is the machine in general use for leveling welt shoes, must be adjusted for every variation in size or shape of last. The automatic leveler is so very much faster and does so much better work than the

Acme that it is almost universally used for the regular work going through the factory" (Howard, R. Vol. 2, p. 2034).

> "It was by far the best machine in existence for the regular work of a factory, but where every shoe that came to the machine was of a different size and shape it would take a great deal of time to effect the necessary adjustments between each shoe. Accordingly these two machines occupied quite different fields" (Howard, R. Vol. 1, p. 81, lines 40–44).

By this acquisition the United Company extended its line by adding machines which perform operations for which it previously had no machines and it obtained the special tools and patterns for manufacturing those machines. For some years the United Company had been purchasing Acme leveling machines from the Carver Company and putting them out (R. Vol. 2, pp. 2032–2033, Ints. 1373–1376; Defs.' Ex. 231, R. Vol. 5, p. 458).

Mr. Winslow testified:—

> "This purchase was made at the solicitation of Mr. Hobart, the treasurer of the Carver Cotton Gin Company.... Their regular business had increased so that they had either got to add on to their factory or else dispose of some part of their business, and this portion of their business had been decreasing, and the price paid did not really cover the value of the tools plus the parts of machines" (R. Vol. 1, p. 460, lines 41–45; p. 461, lines 1–4).

As further stated by Mr. Winslow:—

> "The United Company had always been on friendly terms with the Carver Cotton Gin Company and had sold such machines as they made when desired by the trade, and the price paid [the total consideration was $16,883.79] above the inventory value for the machines on hand was less than it could have duplicated the patterns, tools, etc., which the Carver Cotton Gin Company desired to sell" (Defs.' Ex. 231, R. Vol. 5, p. 458).

Since this acquisition the United Company has continued the manufacture of the Carver Company machines at its Beverly factory and has put them out in large numbers (R.

Vol. 2, pp. 2033, 2035, Ints. 1375–1377, 1390; Defs.' Ex. 231, R. Vol. 5, p. 458). As stated by Mr. Winslow (*supra*, p. 726) these machines are all General Department machines and are sold outright (R. Vol. 1, p. 12, line 37 *et seq.*; Vol. 5, pp. 425, 426, 427).

Harry L. Rice and Fred LaChapelle.

This transaction took place January 20, 1909 (P.'s Ex. 128, R. Vol. 4, p. 898). "No manufacturing plant of any kind was acquired" (Winslow, Defs.' Ex. 231, R. Vol. 5, p. 470).

Mr. Howard testified:—

> "The United Company acquired an experimental welting machine embodying a patented invention radically new. This machine put an extra thread on the single-thread side of the chain stitch formed by the machine. . . . That was entirely new. The purpose was to strengthen the 'between substance'" as it is called (R. Vol. 1, p. 71, lines 30–38).
>
> "When we acquired the LaChapelle device he had made only one machine, which was experimental and far from being commercial" (R. Vol. 1, p. 81, lines 13–15).

The machine was protected by several applications upon which patents have since been granted (R. Vol. 1, p. 81, lines 6–12; R. Vol. 2, p. 2031, Ints. 1367–1369).

The consideration in this transaction was $11,500 (Defs.' Ex. 231, R. Vol. 5, p. 470).

The reasons for this acquisition were:—

(1) "In addition to strengthening the stitch it was believed, that by this invention an economy could be effected by using a thinner and less expensive insole than could be used with the present commercial type of welting machine, which puts only one thread inside the channel" (Howard, R. Vol. 1, p. 81, lines 19–23).

(2) Mr. Rice, a large shoe manufacturer, who was an officer of and one of the two largest stockholders in the Richardson Shoe Machinery Company (P.'s Ex. 125, R. Vol. 4, p. 871, Defs.' Ex. 231, R. Vol. 5, p. 478)—

"made it a condition of the purchase of the Richardson machine that the United Company should take over his rights in these inventions at a reasonable price because 'he wanted to get out of the shoe machinery business entirely'" (Winslow, Defs.' Ex. 231, R. Vol. 5, p. 470).

Mr. Howard testified:—

"We have been working on it since we acquired it and have tried it out several times in a shoe factory, but it is not yet commercial. We are still at work with the purpose of developing it into a commercial machine." "It takes a long time to develop one of these machines" (R. Vol. 1, p. 81, lines 15–18; p. 72, lines 3–4).

Ellis Lacer Company.

This transaction took place February 1, 1910 (P.'s Ex. 129, R. Vol. 4, p. 905). The Ellis Lacer Company was engaged in the business of manufacturing by patented machinery patented wire lacers for temporarily securing together the opposed eyeletted edges of shoe uppers to keep those edges at a proper distance apart during the lasting and subsequent operations. The Ellis lacer was the first lacer that had ever been used commercially. This company owned no real estate but leased floor space (R. Vol. 1, p. 72, lines 23–35; p. 80, lines 40–42; R. Vol. 2, pp. 2028, 2029, 2030, Ints. 1351, 1357, 1358; Defs.' Ex. 231, R. Vol. 5, p. 466).

Before this purchase the United Company never had put out any wire lacers, although prior to 1899 a company controlled by a predecessor of the United Company had attempted to develop and market a wire lacer, but "this device had not been successful, and attempts to market it had been discontinued before 1899" (Howard, R. Vol. 1, p. 72, lines 32–33 Defs.' Ex. 275, R. Vol. 5, p. 770).

The United Company could not put out a commercially satisfactory lacer without infringing the Ellis Company's patents because essential features of such a lacer were covered by broad claims in those patents (Defs.' Ex. 275, R. Vol. 5, p. 771).

On the other hand, the United Company controlled several antedating patents. Twenty-nine claims of those patents

were infringed by the Ellis lacers and completely dominated them. As a result of this patent deadlock "each company's patents if held valid and sustained would have prevented the other company from putting out lacers for commercial use" (Howard, R. Vol. 1, p. 81, lines 4–5; Defs.' Ex. 275, R. Vol. 5, p. 771; Winslow, Defs.' Ex. 231, R. Vol. 5, p. 466). Obviously, therefore, the United Company could not enter this new field without acquiring the patents of the Ellis Company, and the object of this purchase was to enable the United Company to go into this business without infringement.

The Ellis Company was notified of its infringement of the United Company's patents and opened negotiations which resulted in this acquisition. By this transaction no shoe machines whatever were required.

> "The only machinery acquired was a machine for making the wire lacer in our own factory. We did not sell or lease this machine, but furnished the product of the machine to the shoe manufacturers" (Howard, R. Vol. 1, p. 72, lines 27–31; Defs.' Ex. 275, R. Vol. 5, p. 771).

Since this purchase the Ellis lacers have been manufactured and sold in large numbers by the United Company. These lacers have, at all times, been fully protected by ten patents obtained from the Ellis Company or maturing on applications of the Ellis Company, the oldest of which was granted in 1901 (R. Vol. 1, p. 72, line 33; Vol. 2, pp. 2029, 2030, Ints. 1356–1358).

The Wentworth Company.

This transaction took place February 3, 1910 (P.'s Ex. 130, R. Vol. 4, p. 913). The Wentworth Company "owned no real estate. Leased floor space in a building in Cincinnati, Ohio, and employed about twelve men" (Winslow, Defs.' Ex. 231, R. Vol. 5, p. 449).

The Wentworth Company was putting out two patented machines, a heel seat beating machine and a shank sticking machine (R. Vol. 1, p. 73, lines 4–17; p. 80, lines 26–28, 34–38; R. Vol. 2, p. 2026, Ints. 1342–1344).

The Wentworth heel seat beating machine flattened the heel down by rubbing it with a yielding tool but did not beat

the heel. The United Company had a machine of an entirely different type "which flattened the heel by hammer blows." That machine was discarded after the Wentworth acquisition (R. Vol. 1, p. 73, lines 18–26).

The Wentworth shank sticking machine performed an operation which had been a hand operation before the introduction of that machine. The United Company did not have a commercial shank sticking machine and "it was experimenting on one with difficulty, because the Wentworth Company had a patent on theirs" (Howard, R. Vol. 1, p. 73, lines 29–34; p. 80, lines 28–31).

The Wentworth heel seat beating machine infringed twenty-three claims of a patent owned by the United-Xpedite Finishing Company (controlled by the United Shoe Machinery Company) and a suit brought on those claims had been prosecuted to final hearing and the claims were held to be valid and infringed. This machine also infringed thirteen claims of another patent owned by the United Company upon which a successful suit had been brought.

> "The patents upon which these two suits were brought covered indispensable features of the Wentworth machine and The Wentworth Company could no longer put out their heel seat beating machine" (Howard, Defs.' Ex. 275, R. Vol. 5, p. 772; R. Vol. 1, p. 73, lines 27–28).

Also the Wentworth shank sticking machine infringed three claims of a patent owned by the United Company (Defs.' Ex. 275, R. Vol. 5, p. 772).

Mr. Winslow testified that "prior to the decision of the litigation the Wentworth Company had approached the United Company many times to dispose of their business," and stated that "immediately after the decision they asked to open the negotiations with the United Company, which finally resulted in the purchase." He also testified,—

> "A great many of the Wentworth machines that had been put out were in the hands of our lessees, and as the easiest way of disposing of that whole question it seemed to be better to make a trade with the Wentworth Company and settle the litigation" (R. Vol. 1, p. 458, lines 5–9; Defs.' Ex. 231, R. Vol. 5, p. 449).

After the acquisition the Wentworth machines were manufactured at the United Company's Beverly factory, "from which factory the machines and parts have been supplied by the United Company" (Winslow, Defs.' Ex. 231, R. Vol. 5, p. 449). Mr. Howard testified that in further developing the United Company's shank sticking machine "the United Company eventually combined the best features of its experimental machine and the best features of the Wentworth machine in the machine which it is now putting out." That machine has been put out in large numbers (R. Vol. 1, p. 73, lines 31–34; R. Vol. 2, p. 2027, Int. 1348).

B. F. Sturtevant Company.

This transaction took place February 23, 1910 (P.'s Ex. 131, R. Vol. 4, p. 928). The B. F. Sturtevant Company "owned real estate at Conway, N.H., where it operated a factory for the manufacture of peg-wood and wood shanks. Number of men employed about twelve." The amount paid for the property, including "all the real estate . . . the mill site, the mill building, the storage buildings, and all other buildings" (P.'s Ex. 131, R. Vol. 4, p. 928) was $52,185.94; this price being based upon the inventory. "No machines that are used in the manufacture of shoes were obtained in this transaction" (Defs.' Ex. 231, R. Vol. 5, p. 466; Howard, R. Vol. 1, p. 74, lines 4–5).

The object of this purchase was to obtain a permanent and assured source of supply of manufactured strips of peg-wood for use on the pegging machines put out by the United Company, and of wooden shanks for shoes, both of which articles were supplied by the United Company to its customers. The United Company never had been engaged in the manufacture of peg-wood or wooden shanks, but had previously obtained its supply entirely from the Sturtevant Company, which was one of several manufacturers that were engaged in the peg-wood business. This business of the Sturtevant Company has been continued by the United Company at the same place with substantially the same number of men employed, and customers have been furnished with the Sturtevant products

just as before (R. Vol. 1, p. 73, lines 43–44; p. 74, lines 1–2; p. 80, lines 14–25; R. Vol. 2, p. 2046, Int. 1452; p. 2060, Int. 1521; Defs.' Ex. 231, R. Vol. 5, p. 466).

Adam H. Prenzel.

The transaction with Adam H. Prenzel, who is a shoe manufacturer at Halifax, Pa., took place November 22, 1910 (R. Vol. 2, pp. 2024, 2025, Ints. 1329, 1335; P.'s Ex. 143, R. Vol. 4, p. 1046). Mr. Howard testified:—

> "By that agreement the United Company acquired several machines which Prenzel had invented for use in producing a novel patented spring heel shoe, entirely different from any spring heel shoe ever before known. . . . The numerous Prenzel inventions related to turn shoes and for the first time made it possible to sew the sole to the upper all the way around and produce a satisfactory product. . . . Spring heel shoes are turn shoes."
>
> "It also acquired a machine for use in producing an infant's shoe, known as a 'cack.' . . . That machine was used, after the shoe had been finished, to press down the heel end of the sole so as to form a little heel, and at the same time it pressed in a heel seat piece to fill the space made by pressing down the heel end of the sole" (R. Vol. 1, p. 75, lines 43–45; p. 76, lines 1–18).

These were the only machines acquired from Prenzel. The patents acquired from Prenzel covered not only the machines for making these two novel shoes, but also covered the shoes themselves and the processes employed in manufacturing them (R. Vol. 1, p. 76, lines 19–20; R. Vol. 2, pp. 2023, 2024, Ints. 1328, 1330).

Mr. Howard further testified:—

> "The United Company had no machines for performing the special operations which were performed by the machines secured from Prenzel. It puts those machines out now and they are used by manufacturers" (R. Vol. 1, p. 76, lines 20–23).

One of the machines "which Prenzel was using in the manufacture of his improved turn shoe infringed two allowed claims of an application owned by the United Company," upon which the patent was granted in September, 1911, and still another improvement which Prenzel had made was incorporated in a machine covered by "several patents owned by the United Company" (Howard, R. Vol. 2, pp. 2327–2329; Defs.' Ex. 275, R. Vol. 5, pp. 772, 773).

By this acquisition the United Company extended its lines of machines and was enabled to supply its customers new machines for making new products. It was also enabled to use three Prenzel patents in one of its important machines (R. Vol. 2, p. 2329).

M. V. Bresnahan & Company.

This transaction took place December 19, 1910. As stated in Plaintiff's Exhibit 144 (R. Vol. 4, p. 1053), M. V. Bresnahan & Company was a copartnership and the property of the concern enumerated in Schedule A of that exhibit comprises personal property only.

They had a patented experimental lasting machine which had not yet reached a commercial stage. They also had "a heel-burnishing machine embodying a novel patented device for spraying the wax on the heel-burnishing tool." That machine infringed two patents controlled by the United Company (Howard, R. Vol. 1, p. 77, lines 1–6, 17–18, 22–23; p. 79, lines 36–38, 42–44; Defs.' Ex. 275, R. Vol. 5, p. 773).

The United Company did not have any machines which would accomplish the results secured by the inventions embodied in the Bresnahan machines.

Mr. Howard testified:—

> "The United Company was making lasting machines and heel burnishing machines, but they did not accomplish the same results as the Bresnahan machines, because they did not have the patented inventions that were in the Bresnahan machines. The Bresnahan lasting machine was only experimental.
>
> "The United Company is experimenting with machines constructed under both patents acquired from

Bresnahan, but has not yet put out any machines. There has not been time yet to make the machines commercial. The United Company has an experimental lasting machine running, embodying the inventions acquired from Bresnahan" (R. Vol. 1, p. 77, lines 18–29).

"The Bresnahan experimental lasting machine was not being marketed at the time by Bresnahan and he was only trying it out. It had not yet reached the commercial stage.

"The Bresnahan improvement on the heel burnishing machine related to the application of the wax. The United Company went to work to make that improvement commercial and give it to its customers. There was a patent application pending on this invention, and the United Company had nothing that would do what the mechanism embodying this invention would do" (R. Vol. 1, p. 79, lines 36–44).

Another important object of this transaction was the composing of a great amount of litigation. Mr. Howard testified:

"The transaction further involved the settlement of a large number of suits which had been pending for many years between the United Company and Bresnahan's concern in the earlier days before he sold out his interests to Plant" (R. Vol. 1, p. 77, lines 7–10).

"There had been a large number of suits, as many as eight or ten, between Bresnahan and the United Company which had been pending for a number of years, nearly all suits for infringements of patents. That litigation was all pending at the time of this acquisition" (R. Vol. 1, p. 79, lines 31–35).

In addition to the infringement suits (R. Vol. 2, p. 2023, Ints. 1325, 1326) there were pending four suits brought by Bresnahan or the Bresnahan Shoe Machinery Company against the United Company in the Superior Court for Suffolk County, Massachusetts (Defs.' Ex. 275, R. Vol. 5, p. 774).

"When Bresnahan sold his interest in the Bresnahan Shoe Machinery Company to Thomas G. Plant in January, 1906, the Bresnahan Company transferred to Bresnahan and Heys, who together owned all the stock of the Bresnahan Company, all interests under this litigation in the state courts between the United Company and the Bresnahan Company" (Howard, Defs.' Ex. 275, R. Vol. 5, pp. 773, 774).

By Section 6 of the agreement relating to this transaction the vendors released and discharged the United Company from all actions, causes of action, claims and demands, etc., "whether brought in their names or in the names of any of them, or in the name of the Bresnahan Shoe Machinery Company or in the name of M. V. Bresnahan & Co., or otherwise" (P.'s Ex. 144, R. Vol. 4, p. 1058).

The agreement for the purchase provided that all of the three partners should enter the employ of the United Company.

Charles P. Stanbon & Company.

This transaction took place April 22, 1911 (P.'s Ex. 145, R. Vol. 4, p. 1065). Charles P. Stanbon was manufacturing shoe machinery in Lynn, doing business under the name and style of Charles P. Stanbon & Company. Stanbon and Thomas G. Plant (Manufacturers' Machine Company) had made an agreement (P.'s Ex. 132, "Exhibit D," R. Vol. 4, p. 972). Plant had made it a condition of the sale of his patents to the United Company that the United Company should assume, and the United Company agreed to assume,—

> "all agreements, obligations and liabilities of said Plant and of said Manufacturers' Machine Company under said existing contracts between said Plant or said Manufacturers' Machine Company and Charles P. Stanbon. . . ." (P.'s Ex. 132, R. Vol. 4, pp. 932, 933, 935).

Mr. Winslow testified,—

> "We gave only the inventory value of the properties, and only because Mr. Stanbon was under option to Mr. Plant. Mr. Plant made it, as I remember it, a requisite of the arrangement that we should take Stanbon's property and then left it with Mr. Stanbon to agree whether he would turn in his property or not" (R. Vol. 1, p. 558, lines 34–39).

Mr. Howard testified,—

> "This Stanbon transaction was carrying out the contract which Plant had made with Stanbon and which the United Company had assumed" (R. Vol. 1, p. 79, lines 27–29).

Stanbon had three important patented machines. "The most valuable thing acquired by the United Company in this transaction was a channel cementing machine, constructed particularly for cementing the channels of the soles of McKay sewed shoes" and "not adapted for use on other kinds of shoes." This machine was patented (Howard, R. Vol. 1, p. 77, lines 38–41; p. 78, lines 36–37; R. Vol. 2, p. 2019, Int. 1304).

Stanbon also had "a very valuable folding machine" which was "of a radically new character." Patent applications were pending on this machine (Howard, R. Vol. 1, p. 78, lines 3–8; Defs.' Ex. 275, R. Vol. 5, p. 776).

Stanbon also had a perforating machine which "was really adapted for doing embossing work . . . ornamenting rather than perforating" (Howard, R. Vol. 1, p. 79, lines 6–8).

These Stanbon machines, which were all of General Department types, were all covered by patents or pending applications (R. Vol. 1, p. 79, lines 25–26; R. Vol. 2, p. 2022, Ints. 1318–1321).

The United Company had a channel cementer which was inferior to Stanbon's and unsatisfactory because the United Company could not use the patented improvements which were on Stanbon's machines, as will be explained later (R. Vol. 1, p. 78, lines 1–2, 38–45; p. 79, lines 1–2).

"The United Company had no folding machine of any description" (Howard, R. Vol. 1, p. 79, lines 15–16).

The United Company had the "Booth Perforating Machine" but "these two machines have distinct fields owing to radical differences in their organizations." The Booth machine "is far more accurate on curved work. . . . The Stanbon machine on the other hand is very much faster and is therefore much better adapted for substantially straight-edge work" and "has unlimited capacity as to spacing." In Defendants' Exhibit 100, a sample of work done on the Stanbon machine, the spacing is "more than double the maximum spacing permissible on the Booth perforator." Also as above explained the Stanbon machine was adapted for doing embossing work, while the United Company's machine was not (Howard, R. Vol. 1, p. 79, lines 6–10; R. Vol. 2, pp. 2020, 2021, Int. 1311).

By this transaction the United Company carried out the agreement with Plant as to his contract with Stanbon, quoted at the beginning of this discussion.

The United Company also extended its line by adding a folding machine, which enabled it for the first time to enter the folding machine field. It acquired a satisfactory channel cementing machine which it did not have before because it could not use Stanbon's patented improvements, and it acquired a perforating machine better adapted than its own for certain classes of work and capable of doing some work which its perforator could not do.

This acquisition also cleared up a serious patent complication.

> "Prior to the Stanbon acquisition, both the United Company and Stanbon had been developing an improved folding machine of a radically new character. Both machines incorporated substantially the same improvements."

and two interferences involving applications owned by the two parties had been declared.

> "The issues were so broad that the party that won the interference could undoubtedly prevent the other party from putting out any machine of this character" (Howard, Defs.' Ex. 275, R. Vol. 5, p. 776).

Also, Stanbon's channel cementer infringed a patent owned by the United Company while, on the other hand, the United Company could not use Stanbon's valuable improvements because—

> "The United Company had been in interference with Stanbon in the Patent Office and had lost before the Court of Appeals, the tribunal of last resort" (Howard, R. Vol. 1, p. 77, lines 43–45; Defs.' Ex. 275, R. Vol. 5, p. 776).

Several other instances of infringements and interferences are set forth in detail by Mr. Howard (Defs.' Ex. 275, R. Vol. 5, pp. 775, 777).

After the acquisition of the Stanbon business the United Company put out the Stanbon Channel Cementer "immediately" and "in large numbers," and it has put out the Stanbon Perforating Machine. Stanbon's folding machine was "only experimental, had not been put out, and was a long way from

a commercial machine when we took it." The United Company has "seldom worked more vigorously upon a machine than we have upon that one," and when Mr. Howard testified in January, 1914, he stated that the United Company "has put out in large numbers folding machines embodying the Stanbon inventions" (Howard, R. Vol. 1, p. 79, lines 4–5, 10–12, 16–18, 23–24; Defs.' Ex. 275, R. Vol. 5, p. 776).

APPENDIX II.

THE EVIDENCE RELATING TO ALLEGED UNFAIR, OPPRESSIVE OR MONOPOLISTIC ACTS OF THE DEFENDANTS, INCLUDING ALLEGED ARBITRARY ENFORCEMENT OF LEASE PROVISIONS.

A. THE EVIDENCE RELATING TO THE CHARGES OF UNFAIR, OPPRESSIVE OR MONOPOLISTIC ACTS OF THE DEFENDANTS, INCLUDING ALLEGED ARBITRARY ENFORCEMENT OF LEASE PROVISIONS, SPECIFIED IN THE BILL OF PARTICULARS FILED BY THE UNITED STATES.

In Section VI of the petition (R. Vol. 1, p. 999) defendants are charged with having made various threats or committed various unfair and oppressive acts. No specific instances are set out in the petition, but a bill of particulars, setting forth the specific instances charged, was filed during the course of the trial (R. Vol. 1, p. 1075). The bill of particulars sets forth over fifty different alleged acts or threats, including a number of instances of alleged arbitrary enforcement of lease provisions which relate to the charges in Section V of the petition (R. Vol. 1, p. 997).

As to the majority of these instances, as will be shown, the United States introduced no evidence at all.

The evidence relating to these charges is set forth below. This summary will be followed by a discussion of the evidence relating to other alleged acts of similar character upon which the United States relies, but which were not specified in the bill of particulars (*infra*, pp. 791–804).

1. Peter Tessier & Company.

In the bill of particulars it is claimed that the United Company removed its leased machinery from the factory of Peter Tessier & Company of Haverhill, Mass., where a Duplessis turn sewing machine was being operated (R. Vol. 1, p. 1076(1)).

Peter Tessier, as a witness for the United States, said that he had been engaged in the shoe manufacturing business at Haverhill, that he used a Goodyear sewing machine for a time,

that he installed a Duplessis sewing machine, that Octave Paquette, the agent of the United Company in Haverhill, came to him and presented a letter signed by the United Company (R. Vol. 1, p. 281, lines 13–19). This letter read as follows (P.'s Ex. 158, R. Vol. 4, p. 1107):—

> "You are hereby notified that in the exercise of our rights in the premises we have elected to terminate all leases and licenses which have heretofore been granted to you covering machinery belonging to us, including herein specifically the following leases and licenses, viz:—
> Metallic Department lease and license, No. 803, dated April 6, 1901;
> Metallic Department lease and license, No. 803A, dated January 4, 1904;
> Goodyear Department lease and license, No. 5486, dated December 18, 1902;
> and to terminate all right and privilege to use any of the machines belonging to us which have heretofore been delivered into your possession.
>
> "The said leases and licenses and said rights and privileges are accordingly hereby terminated, revoked and annulled; and we hereby forbid you to use or to permit the use by any other person of said machines or any of them hereafter, or to further use any of the patented inventions embodied in said machines and which by said lease and licenses you are authorized to use.
>
> "And we do further hereby demand that you forthwith deliver to us at our factory in Boston, Massachusetts, in accordance with your undertaking and agreement, all of such machines, including therein specifically the machines designated by name and number as follows, viz:—

Grip Slugging Machine, ...	No. 777
Universal Slugging Machine, ...	2022
Knife Grinder, ...	5571
Goodyear Welt and Turn Shoe Machine, ...	417
Goodyear Turn Channelers	742–2125
Goodyear Moulding Machine, . . .	293"

Tessier testified that this comprised all the machines of the United Company in use in his factory at that time; that he had machines that took the place of them and could get from the Duplessis Company machines for performing similar work; that he could get all those machines from the Duplessis

Company that he had from the United Company for performing similar work (R. Vol. 1, p. 282, lines 20–30).

On cross-examination Tessier said that he had the Duplessis machines in his factory at the time the United machines were taken out (R. Vol. 1, p. 282, lines 32–33).

The United States agreed that these machines were taken out on a replevin writ brought by Mr. Brandeis' office (R. Vol. 1, p. 282, line 34).

Mr. Winslow, the president of the United Company, testified that he sent the notice set out above to Tessier because Tessier had abandoned the use of the company's welt and turn sewing machines and had put in their place Duplessis turn sewing machines. He sent the notice canceling his leases, but as a matter of fact it did not interfere with Tessier going on with his business in the slightest degree; Tessier simply was not using the United machines, and the United Company took them out (R. Vol. 1, p. 448, lines 11–18).

Elmer P. Howe testified: "Peter Tessier also put in some Duplessis machines and it was really violating our lease in the most flagrant way by using our machines to prepare or to finish the work that was done on the Duplessis machines. Furthermore, when his attention was called to the violation of the lease I think he gave up his Goodyear machines without the necessity of actually prosecuting a replevin suit against him"; he had already provided himself with others (R. Vol. 1, p. 668, lines 15–23).

The Court will observe that in the list of machines mentioned in the letter to Tessier, the Goodyear turn channelers and the Goodyear moulding machines were auxiliaries for which no royalty was paid, but which were limited to use with the principal machines, the welt and turn machines; that what Tessier had done was to use the Duplessis machine for the work of the Goodyear welt and turn machines and then finish the work on the Goodyear auxiliaries without paying for their use; and that this was a violation of the condition of Tessier's lease. There was no evidence whatever of any threat made by the United Company or any agent.

2. Ernest Bottomley & Company.

In the bill of particulars it is claimed that the United Company removed its leased machines from the factory of Ernest Bottomley & Company of Haverhill, Mass., where a Duplessis welt and turn machine was being operated (R. Vol. 1, p. 1076 (2)).

Ernest Bottomley testified: That he was a manufacturer of McKay shoes; that he was engaged in 1903 in the manufacture of turn shoes; that he had some machines from the United Company and some from the Duplessis Company. From the Duplessis Company he had the turn machine, the loose nailer, slugger, tacker and stitching machines. From the United Company, the only one he named was a sole rounder. He had had a Goodyear stitching machine. When he took the Duplessis machines he stopped using Goodyear machines. Colonel King, of the United Company, came to him and had a conversation with him the substance of which was that he would have to use either the United Company machines or the Duplessis machines, with the result that he continued to use the Duplessis machines, and the United Company took its machines away (R. Vol. 1, p. 284, lines 24–36).

On cross-examination he said that he had first installed Goodyear machines for doing turn work; he had taken one or more turn sewing machines and some of the auxiliaries that went with them; and that the royalty paid for the use of the turn sewing machines and the auxiliaries was kept track of by the indicator on the sewing machine, which was the principal machine. After he had had these for a while he took turn sewing machines from the Duplessis Company, and stopped using the turn sewing machines obtained from the Goodyear Company. He then notified the United Company that they —Bottomley & Company—would not pay any more royalties for shoes sewn on the Goodyear machines (R. Vol. 1, p. 285, lines 27–35; p. 286, lines 18–33).

Bottomley further testified: "I understood I should choose between the Goodyear and Duplessis machines, that I was free to choose whichever of those I liked. I considered it and made a free choice. As a business probability if I was run-

ning shoes through the Duplessis machines I wouldn't use the Goodyear machines" (R. Vol. 1, p. 287, lines 3–8).

Mr. Winslow testified: "Bottomley had served notice on us that he would not use our machines and would not pay any further royalty. He was using machines which he had also declined to sign the leases on. They had been leased previously to other parties" (R. Vol. 1, p. 448, lines 20–24).

There was no other evidence as to what machines were removed from the Bottomley factory.

Neither the Tessier nor the Bottomley case shows misrepresentation or threat, but simply the justifiable exercise of a plain right, which was resorted to, not to coerce a manufacturer but to protect the company's revenue.

3. The Cases of Mark J. Worthley, Thomas G. Plant Company, A. Garside & Sons, Joseph Caunt, A. E. Little Company.

The United States charged that the defendants or their agents threatened to remove under the terms of their leases their machines which were being operated by the above-named parties because said individuals and firms were operating in their factories machines obtained from the Standard Shoe Machinery Company (R. Vol. 1, p. 1076 (1)).

There was no evidence whatever in support of this allegation. Darrah was the only witness who made any reference to these matters and his testimony did not support the allegation (R. Vol. 1, pp. 334, 335). Since, however, the United States attaches some importance to Darrah's testimony in regard to the Standard Company's Woodward machines in the Worthley and Plant factories (R. Vol. 1, p. 334, line 44-p. 335, line 9), attention should be called to Darrah's admission on cross-examination that those machines infringed the United Company's patents, that infringement suits had been brought, and that the decisions in those suits were in favor of the United Company, holding the Woodward machine to be an infringement of the United Company's patents (R. Vol. 1, p. 337, line 38–p. 338, line 2). That situation affords ample explanation of any apprehension that Worthley or Plant may have expressed to Darrah.

Darrah produced a list of 60 shoe manufacturers who used the Standard Company's machines, which is Plaintiff's Exhibit 160 (R. Vol. 1, p. 338, lines 10–14; Vol. 4, p. 1116).

4. C. B. Lancaster Shoe Company.

The United States claimed: "In 1902 or shortly prior thereto C. B. Lancaster Shoe Company, of Keene, New Hampshire, installed on trial in its factory a tackless lasting machine manufactured by the Tackless Shoe Machinery Company, whereupon the defendant, the United Shoe Machinery Company, gave notice that if such machine was not returned forthwith, it would remove all of its machinery with which the factory of said Lancaster Shoe Company was almost entirely equipped, and as a result thereof said tackless lasting machine was returned and not purchased or leased" (R. Vol. 1, p. 1076 (2)).

There was no evidence whatever in support of this allegation.

5. Nutt & Pratt.

The United States charged that the United Company threatened to remove its leased machinery from the factory of Nutt & Pratt of Natick, Mass., because said Nutt & Pratt had installed a tackless lasting machine obtained from the Tackless Shoe Machinery Company (R. Vol. 1, p. 1076(3)).

No evidence whatever was offered in support of this allegation.

6. T. D. Barry Shoe Company.

The United States charged that "The defendants threatened to take back their machines under the terms of their leases and thereby force manufacturers to remove competing machines which had already been installed in the following instances (R. Vol. 1, p. 1076 (c)):—

"They so threatened T. D. Barry Shoe Company at Brockton, Massachusetts, in or about the spring or summer of 1900, and brought a proceeding to remove from said company's

factory welting, stitching, heeling, lasting, slugging, insole channeling, and other machines, and thus compelled said company to remove a system of machines of like character, except slugging and channeling machines which Barry & Company had obtained from the Standard Shoe Machinery Company" (R. Vol. 1, p. 1077 (1)).

In support of this charge the United States called William A. Hogan, who testified he was part owner and treasurer of the T. D. Barry Company and had been with them for twenty-five years; that the company thirteen or fourteen years ago had machines from the Standard Shoe Machinery Company. He was not sure whether this was before or after the United Company was formed, but at the time he was using United Company machines and Standard Shoe Machinery Company machines. They had from the Standard Company a laster, welter, stitcher, welt beater, and sole-layer, and machines performing similar work from the United Company; that a deputy sheriff served papers on him that they were going to take out some of the United Company's machines; that he stopped him by threatening to shoot him; that he got an injunction against the company; that the injunction was dissolved, and he then agreed to stop using the Standard machines, and the Standard machines were removed from the factory. Before the sheriff came he had no conversation with any representative of the United Company that he could remember. He could not say whether the United machines were actually removed or not (R. Vol. 1, p. 222).

On cross-examination he said that the T. D. Barry Company had leased some machines from the old Goodyear Company before the United Company was formed, including welting machines, stitching machines, and some auxiliary machines that he used with them. They had then introduced into the factory some Standard welting, stitching, and lasting machines, and did their welting and stitching on the Standard machines and used the Goodyear machines for the auxiliary work for those machines, so that they were getting Goodyear auxiliary machines for nothing and using them on shoes that were welted and stitched on the Standard machines. In that situation the United Company brought a replevin writ to get back its own property and that was the time that the

officer came. When Mr. Barry, who had been in Europe, came home, the whole affair was straightened out (R. Vol. 1, p. 223, lines 12–42).

Elmer P. Howe testified that T. D. Barry Company were using Goodyear auxiliary machines with regard to which the United Company had no opportunity to determine the extent of use, and therefore had no means of collecting royalty. That is, they were using Goodyear auxiliary machines to prepare and finish the work which was sewed and stitched on Standard welt and turn sewing machines and Standard stitching machines (R. Vol. 1, p. 667, line 44 *et seq.*).

This was another instance where because of the fact that the use of auxiliaries in the Goodyear department was paid for only through and by the royalty measured or recorded by the principal machines, the shoe manufacturer was unfairly treating the United Company by using its auxiliaries in connection with some other persons' principal machines, and therefore getting the use of the auxiliary machines for nothing.

7. Curtis & Jones.

The United States charged that the defendants likewise threatened Curtis & Jones, and caused them to remove from their factory a full or nearly full line of machines which they had leased from the Duplessis Shoe Machinery Company (R. Vol. 1, p. 1077 (2)).

In support of this allegation the United States called Thomas H. Shinn, who testified that he was superintendent of the Curtis & Jones factory; that that firm formerly had two factories, one at Hamburg and one at Reading (Pa.). In the Hamburg factory they used the Lincoln sewing machine made by the Campbell Company, but did not use at that factory any machinery of the United Company except loose nailers and possibly eyeletting machines; but later they combined the Hamburg and Reading factories in one building at Reading and moved the Hamburg plant to the new Reading plant. At the Reading plant before the removal they had had a full line of Goodyear machinery from the United Company for

making turned shoes; that about the time of removal they bought three Duplessis sewing machines and installed them together with the Lincoln machines in the Reading factory, which was built on a hollow square. When at the Hamburg plant they had had metallic machines of the United Company no objection was made by the United Company to the use of the Lincoln sewing machines, beyond calling attention to the merits of their own system and trying to persuade the company to dispose of the Lincoln machines and put in Goodyears.

After the removal to Reading, Mr. Clark, the Philadelphia district manager of the United Company, called upon the witness and stated that the company had broken its leases by starting Duplessis machines in connection with Goodyear machines. Colonel King called later but said nothing about the continued use of the United machines, if Curtis & Jones continued to use the independent machinery, but the local agent, Mr. Clark, said that the United Company would remove all their leased machines unless Curtis & Jones discontinued the use of the independent machines. An arrangement was then made that Curtis & Jones should turn over to the United Company the independent machines, for which they would pay the cost, and replace them with Goodyear machines (R. Vol. 1, pp. 363–366).

The witness said he could probably have duplicated any of these machines which they had from the United Company, except the loose nailing machines. This change to machinery of the United Company apparently increased the cost of doing work one-half a cent a pair (R. Vol. 1, p. 366, lines 13–34).

On cross-examination he testified that when the change was made from Hamburg to Reading they built an entirely new building, and abandoned the old Reading factory and moved both of the old factories to the new one, with the idea of centralizing their business in one factory, with one office and running it as one factory. The factory happened to be built on four sides of a square to get light, but there was no separation of one side from any other side; it was open right around the square.

At the Hamburg factory, where they were using the United Company's loose nailer, they were using any sewing machines

that they wanted to, without any interference of the United Company, on the same shoes. When they moved into the new factory they put all their sewing machines and stitching machines on one floor in the making-room, so that the Goodyear and Duplessis machines were practically side by side. The Lincoln machines were on the same floor, on the other side of the building, but still in the same making-room (R. Vol. 1, p. 367, lines 13–41).

Witness further testified, "Up to that time, I think, *whatever turn machinery we had we had from the old Goodyear Company and whatever agreements we had were agreements made with that company*" (italic ours) (R. Vol. 1, p. 368, lines 3–6).

The witness was then shown a lease dated June 3, 1892, from the Goodyear Shoe Machinery Company, and another lease dated 1897, also from the Goodyear Company, *covering the Goodyear turn machines both principal and auxiliary which Curtis & Jones had.*

To these leases was attached a rider reading as follows:—

> "The lessor hereby agrees that the rent and royalty to be paid by the lessee for children's turned shoes made after January 1, 1897, shall be one cent per pair instead of two cents per pair as provided in the schedule of section third of said lease, on condition, however, that the lessee while he retains possession of any machine leased to him by the lessor shall not without the consent in writing of the lessor use or allow to be used in his factory any sewing machine for uniting the soles of turned shoes to their uppers which is not leased to him by the lessor."

This was executed October 7, 1897, by the Goodyear Company and Curtis & Jones Company (R. Vol. 1, p. 368); the leases to which this rider was attached were Defendants' Exhibits 96 and 97 (R. Vol. 5, pp. 125, 131).

The witness said that the introduction of the Duplessis machines was in violation of this agreement, and that he could suggest no reason why they should not live up to their agreement (R. Vol. 1, p. 369, lines 16–24).

Prior to 1902 Curtis & Jones had held their loose nailer on terms by which they could use it with machinery of anybody else they wanted to. In 1901 they learned that the United

Company was offering its metallic machines on a different form of lease which had been agreed upon between it and the Shoe Manufacturers' Association. Curtis & Jones wanted to change over to that new form of lease, and on January 17, 1902, Curtis & Jones wrote asking to have their leases changed over to that new form (R. Vol. 1, p. 369, line 45 *et seq.*).

This change was made of their own volition; they had considered the advantages of the two situations and of their own accord wrote asking to have their leases changed (R. Vol. 1, p. 370, lines 17–45).

With reference to the change from the Lincoln and the Duplessis machines to the Goodyear, he said they had given attention to the arguments presented by the Goodyear people upon the advantages of their machinery; that they knew the Goodyear machines were doing good work; that they got no service in taking care of the Lincoln machines from anybody—they had to take care of them themselves, and had to send from Reading, Pa., to Haverhill, Mass., for parts, while the United Company had its depot in Philadelphia, fifty-eight miles from Reading, reached easily by telephone or telegraph; that this was pretty convenient and was a consideration with them; that frequently the United Company's men came down and looked at the machines and instructed operators and that was a great convenience; that the Duplessis Company didn't have any agents nearer than Boston, and to get parts they would have to send to Canada; that they made comparisons between the quality of the work produced on the Goodyear machines and on the other machines, and knew that the Goodyear machines were doing better work, and, in his opinion, the arrangement as to care, supplying of parts and promptness of service was very much on the side of the Goodyear (R. Vol. 1, p. 371, line 41 *et seq.*).

In his testimony on direct with reference to the increased cost of making shoes, he mentioned that the difference of one-half a cent was the difference in the royalty, but that was without giving consideration to the economies resulting from the use of the Goodyear machines, which amounted to considerable. In his opinion, the United Company machines would be the cheapest; considering the service, the trouble and the worry he would have with the other machines the United Com-

pany machines would be the cheapest (R. Vol. 1, p. 373, line 20–p. 374, line 17).

Although Shinn testified, "I don't think Mr. Curtis had anything to do with it" (R. Vol. 1, p. 373, lines 4–5), the United States called Frederick W. Curtis, of the Curtis & Jones Company, to testify regarding this matter. His testimony was substantially to the same effect as Shinn's. Like Shinn he testified on direct that discontinuing the use of the Duplessis and Lincoln machines increased the cost of making their shoes one-half a cent on each pair (R. Vol. 1, p. 381, lines 8–11), but on cross-examination he admitted that he meant only that the change added the royalty of half a cent a pair, but that he did not take into consideration resulting benefits and economies (R. Vol. 1, p. 382, lines 4–7). He explained that they did not get any service with the Duplessis machines and after pointing out the importance of prompt and effective service he concluded: "Taking all things on both sides, I think I agree with Mr. Shinn that the operation of the Goodyear machines was on the whole more economical than the operation of the Duplessis, and on the whole the Goodyear machines did better work than the Duplessis machines" (R. Vol. 1, p. 382, line 15–p. 383, line 5).

This does not support the charge made by the United States that the company threatened Curtis & Jones and caused them to remove the Duplessis machines by any unfair method. Curtis & Jones had obtained and were enjoying a special concession from the old Goodyear Company and were asked to live up to their agreement.

8. Hilliard & Tabor.

The United States claimed that Hilliard & Tabor, who had United Company machines, installed a turn sewing machine of the Haverhill Shoe Machinery Company, and that defendant Winslow, acting for the United Company, pointed out that this machine was being operated in violation of the United Company's leases and threatened to change the terms of said leases and to make them more onerous if such Haverhill machines were purchased and installed (R. Vol. 1, p. 1077 (d)).

In support of this claim the United States called Frank R. Hilliard, who testified that he manufactured women's welts, turns, and McKays, having an output of four thousand pairs a day. In 1899 he was using in his factory machines of the Goodyear Shoe Machinery Company and the National nailer. About a year and a half prior to the giving of his testimony (June, 1913), he attempted to install a turn sewing machine of the Haverhill Shoe Machinery Company. After he had been running it about four or five months he was on one occasion at the office of the United Company and Mr. Winslow stated that they were using that machine contrary to their lease and that they would either have to change the lease and the contract with the United Company or stop using the Haverhill machine. The Haverhill machine did satisfactory work. They had it on trial but had made no arrangement with the Haverhill Company at that time. It had been offered on royalty or on purchase. Mr. Winslow's objection partially caused them to return the Haverhill machine. The other reasons were that the machine was in on trial and they had not come to any absolute conclusion in regard to the matter (R. Vol. 1, p. 282, line 39 *et seq.*).

On cross-examination he said that he had had the Haverhill machine for making turn shoes four to six months before he talked with Winslow, without any protest or objection. He had occasion to go to the United Company's office and happened to meet Mr. Winslow. The witness had a lease of Goodyear machines on which he had paid no initial premium. He got the United Company turn machine and paid for it according to the extent to which he used it. He had auxiliary machines with it and was using the auxiliary machines with the Haverhill machine. The effect of what he was doing was this: He took the Haverhill machine on trial and used the Goodyear auxiliaries with it, for which use he did not pay a copper to the United Company. The lease provided that he should use the Goodyear auxiliaries only with the Goodyear principal machine. Winslow called his attention to this and the witness said it was true. Winslow said if he wanted to use the Haverhill machine he could change his lease and take another form, and he offered to give the witness that form of lease. The witness took the matter under consideration and

decided he would rather keep the form of lease he had than change over his lease and use the Haverhill machine. There was no threat or coercion. Everything was perfectly courteous and businesslike, and it was left for the witness to decide which he preferred. The election was his own choice and was satisfactory to him (R. Vol. 1, p. 283, line 28–p. 284, line 5).

The witness further testified: "The change which was to be made, provided we retained the Haverhill machine, was that we were to pay for the machines which we had. He did not say anything about paying an installation charge for the machine. . . . He did not fix the price for the machines; just said that he would have to change the leases" (R. Vol. 1, p. 284, lines 8–11, 18, 19).

Louis H. Harriman, treasurer of the Haverhill Shoe Machinery Company, testified: "Our machines were operated for a time and then removed from Hilliard & Tabor's factory, and were removed for the reason given by Mr. Hilliard" (R. Vol. 1, p. 317, line 45; p. 318, lines 1, 23–25). On cross-examination he said that Hilliard & Tabor "took our machines on trial for thirty days" (R. Vol. 1, p. 324, line 13).

Mr. Donham testified as to the number and variety of United Company's machines which Hilliard & Tabor were using at that time, including many machines on which the United Company did not receive proper compensation, if any, while the Haverhill turn sewing machine was being used instead of the United Company's turn sewing machine (R. Vol. 1, p. 829, lines 17–44; p. 830, lines 1–11).

Mr. Winslow testified: "Hilliard & Tabor, of Haverhill, were using the Fox turn machine and the Pettengill heeler [Haverhill Company machines] and were offered the right to keep any of our machines on the initial-payment plan" (R. Vol. 1, p. 450, lines 38–41).

9. Harsh-Edmonds Shoe Company.

The United States charged that in 1909 the Harsh-Edmonds Shoe Company desired to lease clicking machines, but, on account of the burdensome conditions of the leases of the United Company, made an effort to obtain them from other

parties. Shortly thereafter Mr. Harsh was sent for by the general manager of the United Company and warned and threatened by him with reference to making further effort to procure such machines elsewhere, and was caused thereby to take clicking machines from the United Company (R. Vol. 1, p. 1077 (e)).

In support of this charge the United States called George R. Harsh, who testified that he used clicking machines obtained from the United Company; that he bought one machine from the Richardson Shoe Machinery Company and had tried to have machines made in Milwaukee, but without success; that he had a conversation with Mr. Wilson, assistant general manager of the United Company, in 1908 or 1909; that subsequently he was in Boston. Wilson left word that he would like to see him. The witness called on him and Wilson said it would be better for him if he ceased his activity against the United Company and took things as they were. "He called my attention to the fact that there was a condition of a similar nature to the feature of the clicking machine lease I was objecting to in another lease of another machine, the metallic department lease as I remember it." The witness made no further attempts to get clicking machines elsewhere than of the United Company. He was a stockholder in the Boylston Shoe Machinery Company, to supply his own business with machinery (R. Vol. 1, p. 196, lines 4–34).

On cross-examination he said that he went into business in 1906; that he applied to the United Company for machines and took bottoming room machinery on the non-initial premium lease; machinery for other rooms he obtained elsewhere. He was not clear whether he had obtained the Richardson machine before or after he had talked with Wilson. He went to Wilson's office. Wilson's greeting was courteous. He was a man of exceedingly kindly and courteous personality. Something was said with reference to a clicking machine, and the conversation turned to the fact that the witness was looking for a clicking machine. Wilson told him the United Company manufactured one. Something was said which brought the conversation around to discussing the kind of leases which the witness had, and this presented the situation of the witness being a customer of the company. The witness said something

to the effect that he objected to taking the company's clicking machine lease, and Wilson pointed out that in the form of lease the witness had there was the same or a similar provision. The witness had not appreciated this fact before. Wilson presented this by way of argument to meet the witness' objection, and did it perfectly fairly and quietly. When he had done that he urged the witness to take the United Company's clicking machine. The United Company's clicking machine was the only commercial machine in the market. The witness was a general customer of the United Company and it was giving service with its machines. No other company that he knew of was giving service with reference to clicking machines. Mr. Wilson's advice to the witness seemed to be sound and the witness adopted it. He knew of no reason why as a practical business matter it was not sound. He said it certainly has proved to be sound.

The witness further testified: "We used the Richardson machine only a short time. It was not commercially practicable and that was why we gave it up" (R. Vol. 1, pp. 196–199).

This was all the evidence offered in support of this complaint.

10. Witherell & Dobbins.

The United States claimed that Witherell & Dobbins, manufacturers of turn shoes, contemplated the manufacture of welt shoes, and in the spring of 1911 were threatened by the United Company or its agents that if they continued to operate machines of competitors in making turn shoes the United Company would exact from Witherell & Dobbins installation charges on machines used in the manufacture of welt shoes which were exorbitant in comparison with those made to manufacturers not operating competing machines (R. Vol. 1, p. 1077 (f)).

There was no evidence to support this charge. On the contrary, the list of present users of machines of the Haverhill Company, which was introduced by Mr. Harriman, treasurer of that company, shows that when he testified in June, 1913, Witherell & Dobbins were still using Haverhill machines in-

stalled in 1910 and 1912 (R. Vol. 1, p. 325, line 44 *et seq.*; Vol. 4, pp. 1118, 1124).

11. George A. Learned.

The United States claimed that George A. Learned was engaged in the manufacture of turn shoes and contemplated entering upon the manufacture of welt shoes. "A threat of like character" was made by the defendant company or its agents (R. Vol. 1, p. 1078 (g)).

In support of this claim the United States called George A. Learned, who testified that he had been using United Company's turn sewing machines. In June, 1911, he installed a turn sewing machine of the Haverhill Shoe Machinery Company. He testified that in August, 1911, Mr. Winslow informed him that he was violating a clause of his lease which provided that he should pay three-quarters of a cent a pair royalty on every pair of shoes stitched, whether by the United Company's machine or the Haverhill machine, and that the United Company intended to collect the royalty and 6 per cent. interest; that Mr. Winslow said that he would either have to pay that or they would drive him out of business, and that the least they would do would be to take out all the United Company's machines (R. Vol. 1, pp. 313–314).

Learned was contradicted in this testimony by Mr. Winslow who specifically denied all the statements alleged to have been made to Learned by him with reference to driving Learned out of business or taking out the machines of the United Company (R. Vol. 1, pp. 515–517).

Edwin P. Brown, who was present at the time the conversation occurred, also contradicted Learned (R. Vol. 1, pp. 715–716).

Henry B. Endicott, who heard that Learned was making statements with reference to this alleged conversation, brought him to Mr. Winslow's office and testified that when Learned was there he admitted that he had been mistaken (R. Vol. 1, pp. 582–583).

Edwin P. Brown was also present at the second conversation and corroborated Mr. Endicott, stating that Mr. Learned

in the course of conversation admitted that he was mistaken, and that, as he remembered it, Learned then agreed to write a letter of apology to Mr. Winslow (R. Vol. 1, p. 717, lines 29–45).

Subsequent to the conversation, on August 28, 1911, Mr. Brown in accordance with Mr. Learned's request, submitted a list of machines with the terms upon which the United Company would furnish them for Learned's use in connection with the Haverhill machines (R. Vol. 1, p. 316, lines 13–18, and Defs.' Ex. 86, R. Vol. 5, p. 118). Several letters passed between Mr. Learned and Mr. Winslow on the subject (see Defs.' Exs. 77 to 89, inc., 254, R. Vol. 5, p. 110 *et seq.*, 699).

Mr. Winslow said: The United Company has never at any time taken any machines out of Learned's factory or done anything to interfere with his business or attempted to put him out of business. He has substantially all the machines of the United Company that he had when the correspondence and conversations took place, and is using the United Company's auxiliaries and some of its general department machines to make shoes in connection with the use of the Haverhill Company's machines without paying any royalty on the machines of the United Company (R. Vol. 1, p. 515, lines 42–44; p. 516, lines 24–32).

The fact was that Learned had the Goodyear department turn sewing machine and some auxiliary machines and was using the Goodyear auxiliaries in connection with the Haverhill Company turn sewing machine, so that he was using the United Company's auxiliaries and paying no royalty for their use (R. Vol. 1, p. 515, lines 17–18, 24–29). He was offered the independent form of lease for the United Company's machines if he desired to use the Haverhill machines (R. Vol. 1, p. 515, lines 33–35, 38–41).

12. Harry H. Wentworth.

The United States claimed that in June, 1911, Harry H. Wentworth determined to install heeling machines manufactured by the Haverhill Shoe Machinery Company, but was induced not to install said machines by representations upon

the part of the United Company or its agents that if he should do so the United Company would increase its installation charges upon future orders for machines (R. Vol. 1, p. 1078 (h)).

There was no evidence in support of this charge.

13. Alleged Threat to Enter Shoe Business.

The United States claimed that in certain conferences in St. Louis, in February, 1911, and in Boston, in May, 1911, between Mr. Winslow and Johnson, Florsheim, Rand and Selz, and others, Winslow threatened that the United Company would enter upon the shoe manufacturing business, this threat being made in connection with efforts being made by the manufacturers to secure a modification of the leases of the United Company (R. Vol. 1, p. 1078 (i)).

There was no evidence to support this allegation and it was denied by Florsheim, a witness for the United States (R. Vol. 1, p. 162, lines 9–14).

14. Alleged Threats by William Barbour.

Under the general head of "Threats to use financial resources and power of combination to ruin competitors," the United States claimed that William Barbour in conversation with James N. Darrah, an officer of the Standard Shoe Machinery Company, made certain threats as follows: "'Well, you are making a big mistake because we always try to be nice to people—we offer to buy them at first and then we crush. You can not do anything, because we control the banking influences both in New York and Boston, and you would not be able to get any money. You won't put in your machines because we have the shoe manufacturers in a state of terror. I own a million dollars of that stock, and we can't afford to have any competition. My investment is liable to be jeopardized and we can't afford to have any competition against the United Shoe Machinery Company. We have the field and we are going to retain that field.'" It was claimed that Barbour also said on another occasion to Darrah, when Darrah

suggested that he was going back into the shoe machinery business, "'You would make a big mistake because you would never get in. We will never let you in or anyone else. You will never have a chance to get in. You will never be able to place your machinery with shoe manufacturers. You can't find any customers'" (R. Vol. 1, p. 1078 (a)).

The United States called James N. Darrah in support of this claim, who testified that he met Mr. Barbour at the office of John R. Dos Passos in New York in April, 1900, who introduced him to Mr. Barbour. Barbour said he had a large investment in the stock of the United Company and did not propose to have it jeopardized (R. Vol. 1, p. 333, lines 9–12, 22, 33–35). Barbour said: "'I think you are making a big mistake if you don't sell. . . . We always try to buy out competitors and if we can't buy them out we force them out'" (R. Vol. 1, p. 334, lines 4–8). Barbour also said: "'Where are you going to get your money? You can't get any money to compete against the United Shoe Machinery Company. You can't get any banks to back you up. Our influence both in Boston and in New York is so great that you can't do anything'" (R. Vol. 1, p. 334, lines 20–24). Darrah said that he subsequently met Barbour in 1904 or 1905 and suggested that he thought of going into the shoe machinery business, and Barbour laughed and said it would be a big mistake (R. Vol. 1, p. 335, lines 35–39).

On cross-examination Darrah testified that he was in the real estate business; that he hadn't any office; that he was at the time of his testimony going through bankruptcy; that before he went into the real estate business he was in a stock-broking business; he was not a member of the stock exchange but dealt in unlisted securities; he did that for about three years; for two years he was out of business (R. Vol. 1, pp. 335–337).

Barbour testified with reference to Darrah: "I met the man, but I never made such a statement at all. There was no threat or intimidation at all by language used by me in my conversation with him. There was no suggestion that I regarded him as a competitor who would jeopardize our interests, or that if he did not sell out we would force him out" (R. Vol. 1, p. 860, lines 38–40).

The United States did not call Dos Passos as a witness at all. Upon this charge the District Court found:—

> "The only 'threats' which Barbour is charged with making are testified to by James N. Darrah, vice president in 1900 of the Standard Shoe Machinery Company. According to Darrah, Barbour, at a talk in New York in April of 1900, tried to get him to sell out stock in his company by telling him, in substance, that if competitors of the United Company could not be bought out they would be forced out. Barbour has denied that any such conversation took place. Darrah's evidence was not corroborated; and there is no proof that his concern, though it went out of business in 1901, was ever forced out or crushed by the defendants" (Dodge, J., R. Vol. 1, p. 1148).

15. Richard H. Long.

The United States charged that in 1908 Richard H. Long was engaged in the shoe machinery business in competition with the United Company; that he endeavored to arrange a line of credit with the Chapin National Bank, of Springfield, Mass., but was prevented from doing so by the United Company; that he was offered a credit with the New England National Bank but was refused through the same influence (R. Vol. 1, p. 1079 (b)).

There was no evidence whatever to support this charge. Long's testimony will be found R. Vol. 1, pp. 244–246.

16. J. S. Holt.

In the bill of particulars it is claimed that about 1908 one Bayley, an officer of high rank in the United Shoe Machinery Company, stated to J. S. Holt for the purpose of intimidating said Holt that R. H. Long would be ruined and driven from business by the United Company unless he ceased trying to compete, and that the same fate would befall any other who tried to enter the shoe machinery industry; that the said company would make every effort to ruin Long by destroying his credit and possessed such strong banking connections that it

would be able to prevent Long from obtaining capital to continue operations (R. Vol. 1, p. 1079 (c)).

There was no evidence whatever offered to support this charge. Holt's testimony will be found R. Vol. 1, pp. 280, 281.

17. Harry E. Cilley.

The United States claimed that Harry E. Cilley was told by E. P. Hurd of the United Company in 1901, that he could not do any business except by sufferance of the United Company; that the company did not care for the common law or the Sherman Law, and various other talk of a similar character (R. Vol. 1, p. 1079 (d)).

In support of this the United States called Harry E. Cilley, who testified that he had invented a leveling machine and that he called on Mr. Hurd, who asked him if he had a proposition to make; that Hurd said, "'Cilley, you are thick. If you were offered fifteen or twenty thousand dollars I think under the circumstances you ought to be very well satisfied.'" Cilley replied that this was outrageous. He testified that Hurd also said that the United Company was not an eleemosynary institution and that Cilley could not do business except on its sufferance (R. Vol. 1, p. 278, lines 18–19, 44; p. 279, line 30–p. 280).

On cross-examination Cilley said that he had been in litigation with the United Company since 1903 and had been preparing himself to testify in that case (R. Vol. 1, p. 280, lines 14–24). It was evident from the character of Cilley's examination that his testimony was not reliable.

On this charge the District Court found as follows (Dodge, J., R. Vol. 1, p. 1149):—

> "Mr. Hurd is charged, in the testimony of Harry E. Cilley, with having said to him in 1901, during a conference with respect to a possible sale of his business to the United Company: 'You can't do any business except on our sufferance, and you can't get a new dollar for an old one.' It appears that Cilley's business at the time consisted in building a sole-leveling machine; that he was not satisfied with an amount suggested by Mr. Hurd as a proper price for it, told Mr. Hurd he considered it 'out-

rageous,' and never renewed the negotiations. Neither the business of this witness nor the remarks testified to, if made, can fairly be regarded as of any serious importance, in view of all the circumstances shown.

18. Tower Brothers.

The United States charged that Tower Brothers, engaged in business in making shoe machinery, were greatly injured by their employees being taken away by the United Company and that the United Company threatened to drive Tower Brothers out of business (R. Vol. 1, p. 1080 (e)) .

There was no evidence whatever to support this charge, although John M. Tower of Tower Brothers appeared as a witness for the United States (R. Vol. 1, pp. 907–908).

19. Charles H. Morse.

The United States charged that Charles H. Morse in 1903 was endeavoring to market the Frechette pegging machine and a slugging machine which competed with United Company machines for doing similar work; that Morse called on Mr. Winslow and Mr. Winslow said to him, "You don't suppose we are going to let you continue placing that machine upon the market" (R. Vol. 1, p. 1080 (f)).

In support of this charge the United States called Charles H. Morse, who testified that he called upon Mr. Winslow somewhere about 1901 or 1902, he thought—he could not tell exactly—and talked with Mr. Winslow about a purchase of his business; that Mr. Winslow said, "You don't suppose we are going to allow you to put them on the market," meaning machines which Morse was manufacturing (R. Vol. 1, p. 338, lines 26–35).

It further appears from the testimony of Morse that he continued in business until 1906 when he sold out to Samuel H. Nichols of Brockton, Mass. (R. Vol. 1, p. 338, lines 38–39).

Winslow testified that he had no recollection whatever of making any such statement to Mr. Morse; that he had met Mr. Morse in the corridor of the Court House when Morse

testified, and went up and shook hands with him and asked him how many years it had been since they had met, and Morse placed the date back of 1899, and didn't remember having met Winslow since the formation of the United Company, so if he had ever had any conversation with Morse it must have been prior to the organization of the United Company (R. Vol. 1, p. 518, line 38 *et seq.*).

In respect to this charge the District Court found as follows:

> "Mr. Winslow is charged, in testimony by Charles H. Morse, with having said to him at some time in 1901 or 1902: 'You don't suppose we are going to allow you to put them on the market'—referring to certain pegging machines then being made by the Fifield Company, with which Morse was connected. Morse, on his own testimony, was then negotiating with Winslow about a sale of the Fifield Company business to the United Company, but they failed to agree as to price. Its business was sold in 1906, but not to the United Company. There is nothing to prove that the United Company ever interfered with the marketing of this machine" (Dodge, J., R. Vol. 1, p. 1148, lines 23–32).

20. George H. Clark.

The United States claimed that George H. Clark had invented a method of molding or lasting a shoe and stitching the same on the last, and that he endeavored to introduce this method into various shoe factories; that he visited the United Company and talked with Edward P. Hurd regarding the purchase, lease or rental of a Goodyear rapid lockstitch machine for use in a shoe factory; that Hurd told him: "'Our policy is to stick the knife in deep to the hilt in the case of anyone interfering with our system, and surely your method does interfere. We will never let you have a machine or have one used in any factory where you or your method may be found, for you to experiment with'" (R. Vol. 1, p. 1081 (g)).

In support of this charge the United States called George H. Clark, who testified that he was an inventor and had invented a method for molding or lasting shoes, and that he had put a machine for this purpose in the Richardson factory in Reading; that he called on Mr. Hurd to see if he could get a lock-

stitch machine to put in the Richardson factory; that Hurd replied: "You mean well, but it is against our policy to put a machine in whereby it is going to interfere with our welt system, and we have to put the knife and protect our interests. . . . I won't put any one of our rapid stitching machines into any factory where you are to experiment with" (R. Vol. 1, pp. 306–307).

On cross-examination Clark said that his machine was in the Richardson factory for experimental purposes—had been there perhaps four months—and that he went to Hurd to get a machine to use with his experimental machine, and that Hurd told him he wouldn't put one of his stitching machines in a factory for the witness to experiment with, and said: "'Clark, I will tell you what we must do; we have got to protect our own interests. We must protect ourselves on this method that you have of this flexible welt shoe of yours which jeopardizes our welt system. . . . I don't think it is wise for us to help you out and put a machine in where you are to experiment with'" (R. Vol. 1, pp. 307–308).

21. The Kimball & Hadley Case.

The United States claimed that Kimball & Hadley were manufacturing needles, awls, and drivers in competition with the United Company; that the United Company notified shoe manufacturers if they purchased needles and awls of Kimball & Hadley the United Company would withdraw its machines, and that Martin, an employee of the United Company, told Hadley the United Company would have his business sooner or later, and that Bayley, an employee of the United Company, told Hadley that if necessary the United Company would give its needles away in order to destroy their business; and in fear that their business would be destroyed Kimball & Hadley sold to the United Company (R. Vol. 1, p. 1081 (h)).

In support of this charge the United States called Irving A. Hadley, who testified that he was a lawyer and prior to 1904 engaged in making awls and Goodyear needles; that he called on Mr. Bayley, the agent of the defendants, who inquired of him the price at which he was selling needles. He said, "'We

can manufacture needles and sell them as cheap as the United Shoe Machinery Company.'" And Bayley said, "'Oh, no, you can't; we can give them away if necessary'" (R. Vol. 1, pp. 308–309).

On cross-examination Hadley admitted that he knew at the time of the alleged conversation with Bayley that the United Company did not manufacture any Goodyear needles (R. Vol. 1, p. 311, lines 3–10).

This was all the evidence offered in support of the charge. It appeared that Bayley was in a sanitarium and could not be called to contradict Hadley's testimony (R. Vol. 1, p. 309, lines 39–40). But Hadley also testified that in 1904 he had trouble in making sales of needles and awls to shoe manufacturers, and specified the factories of E. E. Taylor, T. D. Barry & Company, Churchill & Alden, and Rice & Hutchins, as places where he had called (R. Vol. 1, p. 308, lines 28–31). He testified that these manufacturers stated that the using of their needles and awls was in violation of the leases of the United Company, and if they took these awls and needles the United Company would take the machines from their factories (R. Vol. 1, p. 308, lines 31–33).

The defendants offered the evidence of John F. Belcher, who had charge of the purchasing at Churchill & Alden's in 1904. He testified that he talked with Hadley about using his awls and needles and never made any such statement as Hadley had described (R. Vol. 1, p. 746, lines 20–34).

On cross-examination the witness further stated: "During my conversation with Mr. Hadley nothing at all was said about the leases which we had with the United Company, I am positive that the United Company was not mentioned" (R. Vol. 1, page 746, lines 36–38).

Defendants also called Arlon S. Roberts, assistant superintendent of the E. E. Taylor Company, who had charge of the purchasing of supplies for that company in 1904. He knew Hadley and had talked with him about purchasing awls and needles. He denied that he had ever made any such statement as Hadley had testified to (R. Vol. 1, pp. 746–747).

Defendants also called William A. Hogan, who testified that he was connected with the T. D. Barry Company; that he knew Hadley and talked with him about awls and needles;

that he never made any statement to Hadley such as Hadley had testified (R. Vol. 1, pp. 747–748).

Defendants also called James J. Tierney, connected with E. E. Taylor & Company, and having charge of the purchase of awls and needles. He testified that he knew Hadley and positively contradicted Hadley's testimony (R. Vol. 1, p. 760).

Defendants called William O. Bryant, who testified that he was connected with the E. E. Taylor Company; that he knew Hadley, and that he had to do with the purchase of awls and needles. He also contradicted Hadley and testified that he had never made any such statement to him and that he had bought awls and needles of Hadley every time he came to him until he went out of business (R. Vol. 1, pp. 760–761).

Hadley further admitted under cross-examination: "We sold out in 1904. The United Company afterwards brought suit in equity for violating the terms of our agreement and entering into business again, which we had agreed not to do for a number of years, but had done in breach of our agreement. The Supreme Court of Massachusetts found that we had violated our agreement and granted an injunction against us" (R. Vol. 1, p. 311, lines 14–20).

In the case referred to by Hadley, *United Shoe Machinery Company* v. *Kimball*, 193 Mass. 551, the Supreme Court of Massachusetts approved findings of the trial justice (pp. 354, 355) that Kimball & Hadley made the sale to the United Company voluntarily and "that there were, in fact, no illegal threats or illegal intimidation."

In respect to this charge the District Court found as follows:—

> "Bayley, a department manager for the United Company, is charged, in testimony given by Irving A. Hadley, then representing Kimball & Hadley, manufacturers of awls and needles, with having said to him in January, 1904, in answer to a claim by him that Kimball & Hadley could sell needles as cheap as the United Company, that the United Company could give them away if necessary.
>
> "It does not seem possible to attach any serious importance, for any purpose, to the remark, if made, even if anything said at the interview can be supposed to have had reference to a possible purchase by the defendants of the Kimball & Hadley business. Bayley was in a sanitarium, unable to testify, at the trial. Further testi-

mony from Hadley, however, that certain factories had refused needles offered them by him for fear of controversy with the United Company was contradicted by the managers he mentioned. The business of Kimball & Hadley was one of those acquired by the United Company, but it was not acquired until the following June. It consisted in making Goodyear needles, which at the time of the acquisition the United Company was not making at all. An attempt by Kimball & Hadley, in litigation with the United Company some time afterward, to prove that threats and intimidation had been used in acquiring their business wholly failed (see *United Co.* v. *Kimball*, 193 Mass. 351)" (Dodge, J., R. Vol. 1, p. 1149).

22. Samuel A. Krewson.

The United States claimed that the defendants entered into negotiations with Samuel A. Krewson, an inventor of shoe machinery, with a view to purchasing his inventions; that Krewson had a talk with E. L. Hurd of the United Company, and that Hurd said that the United Company could make scouring wheels and put them out cheaper than Krewson, and said, "We do it to drive little fellows like you out of business," —and other statements to the same effect (R. Vol. 1, p. 1081 (i)).

No evidence whatever was offered in support of this charge.

23. Alleged Acquisition of Patents and Suppression of Inventions.

The United States charged that the United Company had systematically, for the purpose of preventing others from making practical use of various patented devices, acquired patents and suppressed or failed to make practical use thereof; also that by suits and threats of suits for alleged infringement they had prevented the manufacture of unpatented machines (R. Vol. 1, p. 1082 (a-b)).

No evidence whatever was offered in support of these charges and they are disproved by the testimony of defendants' witnesses. Mr. Winslow testified, "The United Company has

suppressed absolutely no machines, no inventions and no improvements" (R. Vol. 1, p. 433, lines 27–28).

Mr. Howe testified, "The United Shoe Machinery Company has never suppressed an invention that it thought could be worked out to make a commercial machine which would benefit the lessees. . . . I have never known of a single patent which had prospective value when embodied in machinery being laid on the shelf or suppressed" (R. Vol. 1, p. 671, lines 18–20, 23–25).

In respect to these charges the District Court found as follows:—

> "Nor has there been any evidence sufficient to show a practice followed by the defendants of buying up patented inventions to hold in disuse. This charge also is one not insisted upon in argument" (Dodge, J., R. Vol. 1, p. 1147, lines 8–10).

24. Charge as to Rebates upon Gem Flexible Insole Machines.

In the bill of particulars it is claimed that the defendants granted to exclusive users of their leased machinery rebates of amounts equal to the sums paid by them respectively as royalty on Gem flexible insole machines for the purpose of effecting exclusive use of defendants' machinery (R. Vol. 1, pp. 1082–3 (a)).

The vote by the directors of the United Shoe Machinery Company of January 29, 1900, was as follows:—

> "That a rebate be granted to exclusive users of the machines leased or controlled by this company and its subsidiary companies, and to such other manufacturers upon such special terms as the general manager may consider expedient; said rebate to be made by quarterly payments to the manufacturers of the amounts equal to the sums paid by them respectively as royalty on the Gem flexible insole machines during the quarter for which the rebate is made" (R. Vol. 1, p. 351, line 43 *et seq.*).

With reference to this matter Mr. Winslow testified as follows:—

> "It was almost immediately after the United Company was formed and after we had acquired possession of

the Gem Insole Company that we decided to turn back to the manufacturer the royalty on the Gem insole machine. As to why the Gem insole machine was not put in as an auxiliary machine rather than putting it out on a separate lease, I don't know unless it was because a lot of Gem insole machinery was put out on leases of the Gem Insole Company and it was simpler to keep up those old leases and return the royalty to the lessees" (R. Vol. 1, p. 682, lines 21–34).

Mr. Howe testified as follows:—

> "After the United Company was formed it acquired the Gem insole machines, which previously had been put out on a royalty, and after that paid back the royalty to all manufacturers who used the Goodyear principal machines entirely. So that in effect Gem insole machines were made auxiliary machines to build up the Goodyear welt system" (R. Vol. 1, p. 664, lines 31–35).

In respect to this charge the District Court found as follows:—

> "The vote of 1900 was that royalties on the Gem insole machines be rebated to exclusive users of the company's machines. It appears that having acquired the Gem Company, which had machines in use under lease at the time at a royalty of one-half cent per pair, the United Company added the machine to its Goodyear auxiliary set, and to users of such sets paid back the one-half cent per pair in order to leave the rate upon the entire auxiliary set the same as before it included the Gem machine" (Dodge, J., R. Vol. 1, p. 1147, lines 18–25).

The Court further found that this act on the part of the United Company cannot "be said to answer to the terms in which the charge of offering and granting rebates is made." That the act was inspired by the purpose of giving exclusive users of the company's machines an unfair advantage over those who did not, or that it had that effect, "can not be said to have been proved, and the charge is not believed to require further notice. It would seem to have been suggested by those cases relating to railroads wherein 'rebate' has acquired an obnoxious signification" (Dodge, J., R. Vol. 1, p. 1147, lines 33–41).

25. Charge as to Rebates upon Goodyear Machines.

In the bill of particulars it is claimed that defendants, for the purpose of effecting exclusive use of their machinery, granted a rebate of not less than 15% of the royalties received from leases of certain Goodyear machines (R. Vol. 1, p. 1083 (b)).

The circular letter of June 10, 1910, upon which this charge was based appears as Plaintiff's Exhibit 146 (R. Vol. 4, p. 1067). This letter first calls attention to the services rendered by the United Company to its lessees in the way of improved machines, reduction of installation charges, reductions in royalties, furnishing auxiliary machines, establishment of branch offices, etc. The plan complained of is then announced as follows:—

> "Benefits of a character similar to those enumerated have marked the course of the Company from the very beginning; but it has never been its purpose to confine within limits determined in advance, its ability to enhance the prosperity of the trade. Always recognizing that it has a common interest with its lessees and that its prosperity depends upon theirs, it has long had in contemplation the following plan, which, now that the elimination of initial charges has been effected, it is prepared to put into operation—a plan which is in conformity with its established policy and which it believes will result in the expansion of its own business through the increased business of its customers.
>
> "Beginning with January 1, 1910, the Company will create a fund by investing each year, for three years, in the common stock of the United Shoe Machinery Corporation a percentage, increasing each year, of the amounts received from its lessees for the use of its Goodyear Welting, Goodyear Stitching and Goodyear Turn Sewing Machines in the United States, and will add to that fund from time to time the dividends which shall have been paid in the meantime upon such stock, or shares of the common stock of the Corporation purchased with such dividends. At the end of three years from that date it will distribute the entire amount of stock held in the fund among those lessees who use the Goodyear Welting, Goodyear Stitching and Goodyear Turn Sewing Machines in the United States and who shall have faith-

fully observed the covenants of their leases; each lessee of these classes of machines to receive a share of the entire fund proportionate to the amounts paid by him for the use of such machines."

This offer did not require an exclusive use of the United Company's machines, but merely proposed to return a portion of the royalties received from lessees' machines who used Goodyear welting, stitching, or turn machinery if they observed the covenants of their leases, which, of course, they were legally required to do. It, therefore, amounted merely to a reduction in the royalties charged for this machinery, such reduction to be represented by stock of the United Company instead of by a cash reduction.

This proposal was called to the attention of the Department of Justice and prior to the distribution made to the manufacturers Mr. Choate, in behalf of the United Company, called the matter to the attention of the Attorney-General of the United States in the following letter:—

"CHOATE, HALL & STEWART,

BOSTON, MASS., Feb. 7, 1913.

Hon. GEORGE W. WICKERSHAM,
Attorney-General, Department of Justice, Washington, D.C.

MY DEAR MR. WICKERSHAM: In 1910 the United Shoe Machinery Company advised its lessees that it proposed to put in effect a plan by which a certain proportion of the royalties should be invested in stock of the corporation, and at the end of a fixed term be distributed to lessees of the Goodyear welting and stitching and turn-sewing machines, who had in all respects observed the obligations of their leases. The period covered by this plan expired December 31, 1912, and the company proposes to make a distribution on or about March 1st, as it is bound to do by its agreement with the customers. This plan was, I think, fully called to the attention of Mr. Gregg while he was here examining the affairs of the company and as I read the bill in equity filed by the United States against the company, it does not seem that any complaint is made upon this ground. Under these circumstances, the Company proposes to make the distribution provided for in that plan on the first day of March, or as soon as possible thereafter; and has desired

me to call the matter to your attention that the plan may not be carried out without the knowledge of your department.

I send you herewith a copy of the circular of June 10th, 1910, which describes the plan.

Very truly yours,

CHAS. F. CHOATE, Jr."

(R. Vol. 1, pp. 979, 980.)

In response to this letter, no acknowledgment, answer, or objection of any kind was received (R. Vol. 1, p. 980, lines 23–24).

In respect to this matter and the Gem insole rebates above discussed the District Court found as follows:—

> "Neither of these acts on the company's part can be said to answer to the terms in which the charge of offering and granting rebates is made. That either act was inspired by the purpose of giving exclusive users of the company's machines an unfair advantage over those who did not, or that either had that effect, cannot be said to have been proved, and the charge is not believed to require further notice. It would seem to have been suggested by those cases relating to railroads wherein 'rebate' has acquired an obnoxious signification" (Dodge, J., R. Vol. 1, p. 1147, lines 33–41).

26. Alleged Purchases of Competitors' Businesses at Exorbitant Prices.

The United States charged that the defendants had purchased the business of competitors and prospective competitors to eliminate competition, paying therefor, in many instances, exorbitant prices (R. Vol. 1, p. 1083 (a)).

It having been shown that no competitors in the proper sense of that term were purchased, this charge necessarily fails.

Furthermore the United States failed to introduce in respect to any of the acquisitions, any evidence as to the value of the property purchased. In most cases the price paid was small, and in no case was there the slightest evidence that it was exorbitant.

In respect to this charge the District Court found as follows:

> "An allegation in the petition that the business of many competitors was bought at exorbitant prices fails of support in the evidence relating to any specified instance of acquisition among those thus far considered [all except the Plant acquisition]. As to them, indeed, no claim of the kind seems to be seriously urged" (Dodge, J., R. Vol. 1, p. 1142, lines 1–5).

The Court then considered the acquisition of the Plant property and further held as follows:—

> "The charge that competitors have been bought out at 'exorbitant prices' is found not established in the case of the Plant acquisition, as has just been stated. Nor is evidence found sufficient to establish it in the case of any one of the numerous minor acquisitions specified in the petition. It has not been insisted on in argument that this charge is proved as to any one of them" (Dodge, J., R. Vol. 1, p. 1147, lines 1–7).

27. Alleged Attempt to Cause a Strike at Plant's Shoe Factory.

The United States claimed that Morrison, Ross, and Sochat were employed by Charles H. Willson, the assistant general manager of the United Company, to organize the employees and start a strike at the Thomas G. Plant factory in June, 1910 (R. Vol. 1, p. 1083 (1)).

Morrison testified that at the suggestion of one Johnson, he called on Willson with Ross and Sochat, that Mr. Willson's offer was that "if we would organize the place and get him all the information we could for so-and-so machine (*sic*) he would pay us two thousand dollars cash and our expenses, and he would see that we got a job" (R. Vol. 1, p. 346, lines 27–43).

Morrison further testified: "We tried to organize the Plant factory and got something like three hundred members" (R. Vol. 1, p. 346, lines 43, 44). "There was no attempt to strike, only to form an organization" (R. Vol. 1, p. 347, lines 12, 13).

Ross and Sochat told substantially the same story except that Sochat testified that Willson said he would pay one thousand dollars and expenses (R. Vol. 1, p. 350, lines 33, 34.)

Ross testified that they spent $1,500 in entertaining the em-

ployees and giving them a good time. That is $1,500 was contributed—$500 by Morrison, $600 by Ross, and $400 by Sochat (R. Vol. 1, p. 349, lines 11–18); that their pay averaged $15 per week and that his contribution of $600 represented the savings of eleven or twelve years (R. Vol. 1, p. 349, lines 11–41).

They had no papers or receipts or written evidence of any kind to support this story, claiming that they had destroyed all their papers, including receipts and the list of three hundred names (R. Vol. 1, p. 348, lines 14–18; p. 350, lines 5–20; p. 351, lines 29–32).

This story was flatly contradicted by the following witnesses called by the defendants:—

Albert Harrison (R. Vol. 1, p. 728 *et seq.*).
Cross Johnson (R. Vol. 1, pp. 761–762).
Benjamin Epstein (R. Vol. 1, pp. 762–763).
Arthur F. Crouch (R. Vol. 1, p. 763).
Charles F. Connor (R. Vol. 1, p. 764).
Samuel Pearlman (R. Vol. 1, pp. 764–765).
Joseph Beaudreau (R. Vol. 1, pp. 765–766).
Charles Weidman (R. Vol. 1, p. 766).
Harry Johnson (R. Vol. 1, p. 767).

These men testified that they worked with Morrison, Ross, and Sochat in the same room in the Plant factory, and knew them well, and were about with them in and out of the factory; that they had no knowledge of any Union being organized by the three witnesses for the United States, or of any strike being attempted. To their knowledge no money was spent among the employees for entertainments or for any other purpose, and that they never heard of the United Shoe Machinery Company making any attempt to stir up trouble in the Plant factory; that the whole story was simply this: that Mr. Plant had introduced some new lasting machines into his factory and that he increased the wages of the toe lasters. The operation of these machines was slower than the operation of the machines previously used, consequently the men earned less money. Mr. Plant increased the wages of the men operating these machines but did not increase the wages of the men who worked on the pulling-over operation connected

with the lasting; that these latter formed a committee consisting of Morrison, Harrison, Epstein, and Murphy, and went to Mr. Plant and asked for an increase of pay; that the increase was granted and there was no trouble whatsoever.

Mr. Winslow testified that some time in June, 1910, Willson told him that three Armenians had come to him and wanted the United Company to assist them to start a strike in the Plant factory, and he, Winslow, instructed Willson to have nothing to do with them, and to his knowledge the United Company never did anything to foment a strike at the Plant factory and Mr. Willson never did anything beyond the instructions that Mr. Winslow gave him (R. Vol. 1, p. 507, lines 30–44). Mr. Willson died before the trial of this case (R. Vol. 1, p. 261, lines 37–38; p. 262, line 1).

Upon this charge the District Court found as follows:—

> "The only evidence to show that Willson ever gave any such directions or assurances came from three witnesses, employees at the Plant factory in June and July, 1910, who gave their testimony in person before the court. No one else was present, according to their statements, at the various interviews they described between Willson and themselves during the two months just referred to. Willson having died in 1911, and before these charges were made, no direct contradiction was possible of their statements as to what was said by him to them.
>
> "He told them, according to their testimony, that if they would organize a strike at the factory and give him all the information they could about the Plant machines he would pay their expenses, get them jobs, and pay them also $2000 in cash (according to two of them)—$1000 (according to the other).
>
> "Willson never did pay them any money, as they all agreed. But their testimony was that they got about 300 men into an organization and spent about $1500 of their own money in doing so, mainly in entertaining the men who joined. According to their further statements, $600 was contributed by one of them, $500 by another, and $400 by a third; their wages at the time were $15 per week; these sums were the savings of eleven or twelve years; accounts, lists, and vouchers containing details of their doings and expenditures, were kept, but all of these were either surrendered to Willson or destroyed by them. No written evidence of any kind was offered in support of their story.

"It appeared that there was some prospect of trouble between Plant and the employees at the factory at the beginning of June, 1910, but after meeting a committee with regard to an increase of pay asked for, Plant granted it and no strike or other trouble ever occurred. There was no proof whatever that he ever employed detectives to watch the three witnesses in question, or that any attempt by them at organizing a strike ever came to his knowledge.

"The testimony of these three men was not corroborated by any others of the then employees at the factory. On the contrary, several of them, shown to have had ample opportunity for knowing the facts had there been any such organization attempted as testified to, denied any knowledge of such organization or of any such preparation for a strike.

"Winslow, president of the United Company, testified that Willson had told him, in June, 1910, that three Armenians had been to him asking that he furnish them with money to start a strike in the Plant factory, and that his instructions to Willson thereupon were to have nothing to do with them. No money of the United Company was ever paid out for any such purpose.

"Not only does the evidence of these three witnesses appear unworthy of belief in view of its improbability, its lack of corroboration, and the evidence tending to discredit it, but it is difficult to understand how the petitioner could seriously have expected the court to accept such testimony, or have considered itself justified in offering it" (Dodge, J., R. Vol. 1, p. 1151, line 30–p. 1152, line 34).

28. Solomon N. Cutter.

The United States also claimed that the United Company had employed one Solomon N. Cutter to enter the employ of the Standard Shoe Machinery Company and obtain information as to its condition (R. Vol. 1, p. 1084 (1)).

There was no evidence to support this charge. (Cutter's testimony will be found R. Vol. 1, p. 332.)

29. Harlow Shoe Finishing Machine Company.

The United States claimed that the Harlow Shoe Finishing Machine Company was engaged in manufacturing burnishing

machines in competition with the Xpedite Company, and that in 1911 George H. Harlow, the president of the Harlow Company, was taken into the employ of the United Company (R. Vol. 1, p. 1084 (2)).

There was no evidence to support this charge, although Edwin E. Bartlett of the Harlow Shoe Finishing Machine Company appeared as a witness for the United States (R. Vol. 1, p. 942).

30. Demonstration of Plant Lasting Machine.

The United States claimed that in 1910 agents of the United Company induced a former laster of the Plant Shoe Company to demonstrate a lasting machine invention operated in the Plant factory (R. Vol. 1, p. 1084 (3)).

This was not denied, but seemed to be a perfectly harmless performance.

31. Reece Buttonhole Machine Company.

The United States claimed that the Reece Buttonhole Company was engaged in the manufacture of buttonhole machinery; that the United Company in order to injure it induced two of its employees to enter the employ of the United Company (R. Vol. 1, p. 1084 (4)).

There was no evidence in support of this charge.

32. Charles P. Stanbon.

The United States charged that Charles P. Stanbon was engaged in making stock-fitting machinery in competition with the United Company, and that to force said Stanbon to sell out the United Company induced certain of his employees to leave Stanbon and enter the employ of the United Company (R. Vol. 1, p. 1085 (5)).

No evidence was offered in support of this charge.

33. Charles S. Johnson.

The United States claimed that one Charles S. Johnson was engaged in the manufacture of the Tripp Giant leveler; that Winslow, president of the defendant company, negotiated with said Johnson for the acquisition of his business; that a contract was prepared which differed from Johnson's proposition and Johnson refused to sign it; that thereupon Winslow said to Johnson: " 'Johnson, you had better sign that contract. We are going to have your business anyway' "; and that six months thereafter the United Company began to manufacture machines which were duplicates of the Tripp Giant Leveler (R. Vol. 1, p. 1085 (1)).

In support of this charge the United States called Charles S. Johnson, who testified that he was connected with the Tripp Giant Leveler Company which put out a machine for leveling the bottoms of shoes; that in 1902 or early in 1903 he had a conference with Mr. Winslow and they came to a verbal agreement as to the acquisition of the company's business by the United Company; that a contract was prepared which was not satisfactory to Johnson and that he refused to sign it, and as he was going out Mr. Winslow suggested that he had better sign it because he was going to have their business anyway, or words to that effect; Johnson said, "I wouldn't say those were the absolute words, but that was the gist of the remark he made to me"; that shortly after the United Company put a machine on the market substantially similar to the Tripp Giant leveler (R. Vol. 1, pp. 304–305). Johnson further testified that his company was absorbed by the Boylston Manufacturing Company in 1905 and that he has been connected with that company ever since (R. Vol. 1, p. 305, lines 14–20).

On cross-examination Johnson said that there was an effort made by those in control of the Tripp Company to have the United Company buy the Tripp Company; that witness himself talked with Winslow for the purpose of selling it; that some verbal understanding was arrived at; that a paper was prepared which the witness thought did not embody all the terms of the oral agreement; that the meeting with Winslow

was perfectly friendly and Winslow was courteous but business-like; that this was eleven years ago; that a Mr. Kelliher for the United States had been to see him about this matter and said in substance that he was employed by the United States to go around and see whom he could find who had complaints to make against the United Shoe Machinery Company, and inquired of the witness in substance whether he had any grievance; that he had a grievance against the United Company, and that he had written articles for trade papers hostile to it (R. Vol. 1, p. 305, lines 21–33; p. 306, lines 1–36).

Mr. Winslow testified that such a contract was drawn, but he did not tell Mr. Johnson that the United Company was going to get his business anyway. He used only such language as he would use with any one. Such language as he used "was not offensive or intended to be offensive in any way or to intimate to him that we would drive him out of business. We have competed with him right along; we have not interfered with his business" (R. Vol. 1, p. 518, lines 25–37).

Mr. Winslow further testified that the interview in question was not in 1902 or early in 1903, as stated by Mr. Johnson, but was later than that. "The interview in 1902 or 1903 was prior to the contract and he then wanted me to acquire their business, but I did not" (R. Vol. 1, p. 519, lines 12–17).

Upon this charge the District Court found as follows:—

> "Mr. Winslow is also charged, in testimony given by Charles S. Johnson, with having said to him during negotiations in 1902 or 1903, regarding a sale of the Tripp Giant leveler, in which he was interested, to the United Company: 'You had better sign that contract because we are going to have your business any way.' But the negotiations did not result in a sale, and the Tripp Company's business, though sold out in 1905, was not acquired by the United Company. Not long after, according to Johnson's testimony, the United Company put on the market machines considered by him to be substantially the same as the Tripp Giant leveler, but there is no other indication of any interference with the Tripp Company or its business by the defendants" (Dodge, J., R. Vol. 1, p. 1148, lines 33–34).

34. Frank L. Harmon.

The United States charged that Frank L. Harmon was an inventor of various shoe machines; that in 1905 Mr. Winslow was endeavoring to purchase some of Harmon's patents, and told Harmon he would see to it that Harmon didn't get any more money to work with; that he didn't have to buy Harmon's machine,—that he could have Harmon's machines if he cared for them and Harmon couldn't prevent it; that the United Company manufactured and leased machines infringing one of Harmon's patents without giving Harmon any compensation; that one H. A. Woodbury furnished Harmon money for experimenting, and negotiated with the United Company for the sale of another of Harmon's patents, that Woodbury assigned the patent to the company relying on representations that if the machine worked the company would pay a substantial sum; that the company tested the machine, which worked perfectly, but the company refused to pay any consideration for it (R. Vol. 1, p. 1086 (2)).

In support of this charge the United States called Frank L. Harmon, who testified that he was developing some machines; that the witness had no practical business ability and came to Mr. Winslow with the idea of getting information; that Winslow gave him some very good advice, to the effect that he was foolish to try to go into the machinery business with little capital; that all the companies were coming together to build their machinery on a large scale, and that he thought the witness would lose his time and money. Harmon said the substance of the conversation was that he could not compete with millions of dollars with a few thousands of dollars in the manufacture of machinery (R. Vol. 1, p. 276).

On cross-examination the witness said that this conversation occurred before the United Company came into existence (R. Vol. 1, p. 277, lines 10–11).

No evidence whatever was offered by the United States, other than this, in support of the Harmon allegation.

35. Euclid I. LaChapelle.

The United States charged that Euclid I. LaChapelle had invented an appliance for holding the uppers to soles during the sewing operation, and also an improvement on the pulling-over machine, and improvements on other machines; that the United Company took LaChapelle into its employ, representing that it would pay him a reasonable consideration for his inventions, that subsequently LaChapelle was discharged and the United Company had perfected his inventions and placed them in operation without any adequate consideration (R. Vol. 1, p. 1086 (3)).

No evidence whatever was offered in support of this charge.

36. Nathaniel Sparks.

The United States charged that Nathaniel Sparks invented a heel-compressing machine and assigned it to William J. Young; that the United Company induced Sparks to make an affidavit denying that he had ever invented such a machine (R. Vol. 1, p. 1087 (4)).

No evidence whatever was offered in support of this charge.

37. T. J. Edwards.

The United States charged that T. J. Edwards was engaged in the business of cutting stamps to be used in stamping shoes; that he was requested by the United Company to compile a catalogue of his stamp cuts; that he compiled such a catalogue but received no orders from the United Company, and that the United Company issued a catalogue which included those cuts furnished by Edwards, and that this catalogue ruined Edwards' business (R. Vol. 1, p. 1087 (5)).

No evidence was offered in support of this charge.

38. Fortuna Machine Company.

The United States charged that the Fortuna Machine Company made a skiving machine; that the United Com-

pany also made a skiving machine, closely resembling that of the Fortuna Company, which it represented to be a Fortuna machine, and discouraged manufacturers from using the Fortuna machine, pretending that it was inferior (R. Vol. 1, p. 1087 (6)).

No evidence was offered in support of this charge, although G. H. Diehl, Jr., president of the Fortuna Company since 1903, appeared as a witness for the United States (R. Vol. 1, pp. 910–911).

39. George E. Rollins.

The United States charged that George E. Rollins invented a certain machine, and that after it was demonstrated to be a success the United Company without any right put out a similar machine infringing Rollins' patent, and placed the same on the market in competition with Rollins' machine and destroyed the value thereof (R. Vol. 1, p. 1087 (7)).

No evidence was offered in support of this charge.

40. A. McDowell.

The United States claimed that A. McDowell invented a spring heel shaver and negotiated with the United Company for its sale; that thereafter the United Company notified him that it had a similar machine of its own, and that that machine was an infringement of McDowell's invention; that McDowell also invented and patented two other machines and that the United Company purposely produced machines embodying the patented features of the McDowell machines and therefore destroyed the value of the same (R. Vol. 1, p. 1087 (8)).

No evidence was offered in support of this charge, although V. H. McDowell, son of A. McDowell, appeared as a witness for the United States and testified that he was familiar with the machines put out by his father (R. Vol. 1, p. 909).

41. Charles L. Clifford.

The United States claimed that the defendants rendered a bill to Charles L. Clifford for royalties on shoes sewed on a Haverhill turn sewing machine (R. Vol. 1, p. 1088 (1)).

In support of this charge they offered the evidence of Charles L. Clifford, whose evidence was excluded by the court (R. Vol. 1, p. 362).

Mr. Winslow testified that the independent lease was offered to Clifford (R. Vol. 1, p. 451, lines 12–14).

42. Fred J. Thompson.

The United States claimed that in 1903 or 1904 Fred J. Thompson was using two stitching machines of the Duplessis Company; that he later installed machinery of the United Company and was obliged to pay royalties to the United Company for all shoes manufactured by the Duplessis machinery (R. Vol. 1, p. 1088 (2)).

No evidence was offered in support of this charge.

43. Alleged Wrongful Exaction of Return Charges.

The United States claimed that the defendants wrongfully exacted return charges from shoe manufacturers on leased machinery in instances where such charges did not properly apply (R. Vol. 1, p. 1088 (e)).

No evidence was offered in support of this charge.

44. Alleged Arbitrary Increase of Charges.

The United States claimed that the defendants had arbitrarily increased the installation, return, and other charges on machinery operated by shoe manufacturers who operated machinery of competitors (R. Vol. 1, p. 1088 (f)).

There was no evidence to support the charge.

45. N. D. Dodge Shoe Company.

The United States claimed that the N. D. Dodge Shoe Company were using Haverhill Shoe Machinery Company machines, but were forced to discontinue their use when they went to the United Company for welt machines; the United Company refused to put in welt machines unless Dodge paid what would be a fair price for the machines when installed, "and yet which gave them no equity in the machines, and they must then pay the same royalties as others who made no initial payment. The United Company required them not only to discontinue the use of the sewing machines, but the channeling machines also" (R. Vol. 1, p. 1088 (1)).

The only testimony which supported this charge was hearsay evidence of L. H. Harriman, treasurer of the Haverhill Shoe Machinery Company (R. Vol. 1, p. 317, line 45), who testified as follows: "We had two turn sewers and two channelers in the factory of N. D. Dodge & Son in 1911. Their use was discontinued because we could not supply a line of welt machinery which they wanted and the United Company would not do so as long as they used our machines" (R. Vol. 1, p. 320, lines 9–13).

William G. Dodge, as witness for the United States, testified as follows: "I got the Haverhill machines in October or November, 1911, but I have not got them now. . . . I discontinued the use of the Haverhill machines after three or four months because the United Company installed some machines that we felt were more efficient" (R. Vol. 1, p. 354, lines 43–44; p. 355, lines 2–5). Further on cross-examination the witness testified: "It was while we were waiting for the new Model G machine of the United Company that we tried some Haverhill machines . . . intending to use them merely until we could get the Model G. As soon as the Model G was ready we installed it and discontinued the use of the Haverhill machines" (R. Vol. 1, p. 355, lines 12–24).

46. Alleged Sales Below Cost.

The United States claimed that the defendants have offered or granted special terms and prices to shoe manufacturers on machinery, parts and supplies, at times below cost, to induce them to withdraw their business from competitors (R. Vol. 1, p. 1089 (g)).

There was no evidence to support this charge.

47. E. P. Reed Company.

The United States charged that in 1900 E. P. Reed Company were using machines of the Standard Shoe Machinery Company; that defendants offered to install their machines free of charge if the Reed Company would discontinue the use of Standard machines (R. Vol. 1, p. 1089 (1)).

No evidence was offered in support of this charge.

48. Alleged Refusal to Furnish Machinery, etc.

The United States charged that the defendants have refused or delayed unnecessarily in furnishing machinery, parts, or supplies to shoe manufacturers also operating machinery furnished by competitors or owned by said shoe manufacturers (R. Vol. 1, p. 1089 (h)).

No evidence was offered in support of this charge, except the evidence of Richard H. Long, which was shown to be unreliable and which was contradicted by the evidence of King, Mrs. Hewitt, and Batchelder (see *supra*, pp. 154–155).

49. Alleged Threats to Remove Machinery.

The United States charged that the defendants have threatened to remove their leased machinery from factories wherein supplies purchased from competitors have been used (R. Vol. 1, p. 1089 (i)).

There was no evidence to support this charge, unless it was in the testimony of Irving A. Hadley, which has already been

discussed, which testimony was contradicted by the testimony of Belcher, Roberts, Tierney, and others (*supra*, pp. 768–769).

50. Alleged Refusal to Furnish Individual Machines.

The United States charged that the defendants have refused to furnish individual machines to shoe manufacturers operating machinery of competitors, such refusals being either absolute or modified by demands for prohibitive installation charges (R. Vol. 1, p. 1089 (j)).

No evidence whatever was offered of any absolute refusal by the United Company to furnish machines under these conditions. Indeed, the testimony of Edwin A. Webster, a witness for the United States, showed that the United Company was constantly furnishing machines to be used in connection with machines of other manufacturers.

Webster, a director of the Haverhill Shoe Machinery Company, testified as follows: "Our machinery is being used side by side with the United machinery in thirty-eight factories, producing the same product. Sometimes a manufacturer will use our turn sewing machine and the United Company's heeling apparatus and sometimes he will use our heeling apparatus and the United Company's turn sewing machines, or will mix them up on some other plan" (R. Vol. 1, p. 299, lines 32–37). (See also P.'s Ex. 161, R. Vol. 4, p. 1118, showing machines of the Haverhill Shoe Machinery Company used in connection with machines of the United Shoe Machinery Company.)

The defendants have always been ready to supply machines of all kinds to be used in connection with machines of any other manufacturer upon the same installation charges which prevailed prior to the organization of the United Company (R. Vol. 1, p. 514, lines 11–43; Defs.' Ex. 40, R. Vol. 5, p. 40). Mr. Winslow named a large number of the manufacturers to whom the choice between the independent form of lease and the restricted form of lease had been offered from time to time (R. Vol. 1, p. 450, line 11; p. 451, line 16). Where a lessee desired an independent lease, the initial premium was always the same or a less sum than had been required before

the United Company was formed (R. Vol. 1, p. 433, lines 29–32).

51. Carleton & Hunt.

The United States charged that Carleton & Hunt were using machines of the Haverhill Shoe Machinery Company and desired to obtain welt machines of the defendants, and were informed by the defendants that they would have to discontinue the use of the Haverhill sewing machine before the defendants' machinery would be installed, or pay an installation charge which was prohibitive (R. Vol. 1, p. 1089 (1)).

The only evidence offered in support of this charge was the hearsay statement made by Louis H. Harriman (R. Vol. 1, p. 320, lines 1–6) to the effect that Mr. Hunt had told him that he had tried to get a set of machines for making welt shoes from the United Company, and that he could not get them unless he discontinued using the Haverhill turn sewing machine.

Mr. Donham's testimony showed that when Carleton & Hunt discontinued the use of the United Company's turn sewing machine and used instead the Haverhill turn sewing machine they continued to use in connection with that Haverhill machine a number of other United Company machines for the use of which the United Company was not receiving any compensation (R. Vol. 1, p. 828, lines 26–44; p. 829, lines 17–33; P.'s Ex. 161, R. Vol. 4, p. 1119).

52. Ira J. Webster.

The United States charged that in June, 1912, Ira J. Webster had been operating two Pettengill nailing machines, which he owned outright, and that he desired to obtain from the defendants a pulling-over machine and a toe-capping machine; that because he was operating independent machinery the defendants demanded excessive installation charges; that he was unable to make satisfactory arrangements with the defendants and the Pettengill machines had been removed from his factory (R. Vol. 1, p. 1089 (2)).

In support of this charge the United States called Ira J. Webster, who testified that he had Pettengill nailing machines; that he applied to the United Company for pulling-over and toe-capping machines; that no objection was made to furnishing him with them; that an installation price was to be paid if the machines were used with the Pettengill nailer that would cost more than if he used their entire machinery. He did not remember what this charge was (R. Vol. 1, p. 362).

On cross-examination he said that before he made his application he used some of the machinery of the United Company and also a Pettengill nailer from the Haverhill Company. Referring to agents of the United Company he further testified: "They offered me two alternatives; they said they would furnish me with the toe capper and puller-over if I would pay an installation charge and a royalty on them, or they would furnish me a full line of machinery at wholesale rates, cheap. That is all there is about that transaction. I don't remember what the installation charge was" (R. Vol. 1, p. 363, lines 4–13).

Mr. Winslow testified that the independent lease was offered to Webster (R. Vol. 1, p. 451, line 12).

B. THE EVIDENCE RELATING TO ALLEGED UNFAIR, OPPRESSIVE OR MONOPOLISTIC ACTS OF THE DEFENDANTS, INCLUDING INSTANCES OF ALLEGED ARBITRARY ENFORCEMENT OF LEASE PROVISIONS, NOT SPECIFIED IN THE BILL OF PARTICULARS FILED BY THE UNITED STATES.

The foregoing discussion of the evidence regarding the charges contained in the bill of particulars shows that as to the majority of those charges the United States did not introduce any evidence and that the record entirely fails to support those charges as to which evidence was introduced.

The United States also claims that the evidence proves other unfair or oppressive acts, which were not specified in the bill of particulars.

These charges are in the main centred about the efforts of rival shoe machinery manufacturers to displace machines of the United Company already in use in shoe factories by substituting their machines.

The shoe manufacturers whom these machinery manufacturers approached were already fully equipped with machines which they had leased from the United Company and had agreed to use so far as they had work for the machines. It would violate that agreement to let those machines stand idle and use machines of others instead. Also in certain instances they held the United Company's machines under restricted leases under which they were permitted and had agreed to use the machines only as a series. The competitor asked them to interject his machines into the series. For example, they held General Department machines which, instead of buying outright, as they could have done, they had elected to take under leases which restricted their use to certain of the United Company's royalty-earning, principal machines. If those principal machines were displaced by a competitor's machines and the shoe manufacturers did not purchase the General Department machines, but continued to hold them under those restricted leases, and used them with the competitor's machines, they would be using them without proper compensation to the United Company (*infra*, p. 796).

The shoe manufacturers who were solicited to install competing machines under these conditions recognized the equities of the situation. They did not want the machines and it was perfectly natural that they should take the easiest way to get rid of the solicitors and plead the United Company's leases as an excuse for refusing to listen to persistent solicitation.

(1) Testimony of Louis H. Harriman, Treasurer of the Haverhill Shoe Machinery Company.

In addition to his evidence regarding the charges in the bill of particulars as to Hilliard & Tabor, Carleton & Hunt, and N. D. Dodge Shoe Company (*supra*, pp. 754, 790, 787), Louis H. Harriman, treasurer of the Haverhill Shoe Machinery Company (R. Vol. 1, p. 317, line 45), testified about a number of attempts

of his company to install machines in shoe factories to displace machines leased from the United Company already in use in those factories.

(a) Frederick W. Herrick.

Harriman testified that Fred Herrick of the Herrick Shoe Company asked him to guarantee to refund to Herrick additional royalty which he would have to pay to the United Company if he operated machines of the Haverhill Company. The Haverhill Company was unwilling to do this and removed its machine because Herrick would not operate it without this guarantee. The Haverhill Company also had to remove its heeling machine "so Mr. Herrick could get the stock which was a rebate on his Goodyear sewing royalties" (R. Vol. 1, p. 318, lines 6–22).

Edwin A. Webster, a director of the Haverhill Shoe Machinery Company, testified that the reason why his company took out the heeling machine was because Herrick "found he would lose his rebate on his Gem insole machine if he kept it longer" (R. Vol. 1, p. 290, lines 30–31; p. 293, lines 1–11).

Frederick W. Herrick, as a witness for the United States, testified that his concern took the Haverhill turn sewing machine on trial and ran it a little less than a month. They used it for work previously done by the United Company's machine, which they kept idle or partly idle while trying the Haverhill machine. They then went back to the United Company's machine. The reason why they discontinued the Haverhill heeler was because they were making high-heeled shoes and the United Company had developed a new machine to attach high heels. Before that machine was developed there were no heeling machines for making high-heeled shoes right. "We got it because we wanted a machine to do that work right" (R. Vol. 1, p. 357, line 38–p. 358, line 21).

Herrick said that the Gem insole rebate was not discussed in connection with the Haverhill machines (R. Vol. 1, p. 357, lines 18–22) and nowhere in his testimony did he speak of the "rebate on his Goodyear sewing royalties" which Harriman

said was his reason for removing the heeling machine. It is plain from Herrick's testimony that he resumed using the United Company's machines because he considered them better for his work than the Haverhill machines.

(b) Lynch & Sherman.

Harriman testified: "We had a turn sewer in the Lynch & Sherman factory which had been operated but a short time when they telephoned us to take it out, as an agent of the United Company had informed them it violated their lease with that company" (R. Vol. 1, p. 318, lines 26–29). This hearsay evidence, which was duly objected to (R. Vol. 1, p. 318, lines 30–38; p. 319, lines 30–32), is all that the record contains in support of this claim.

Mr. Harriman's list of users of Haverhill Company machines (P.'s Ex. 161, R. Vol. 4, p. 1118) shows that Lynch & Sherman had a turn sewing machine from the United Company which of course they had agreed to use. The use of the Haverhill machine and the failure to use the United Company's machine which the lessee had agreed to use were doubtless the violation referred to.

(c) W. S. Chase & Company.

Harriman testified that W. S. Chase & Company had several machines of the Haverhill Company, but, about a year before the witness testified, Mr. Herbert Chase told them to remove the machines "because he had been sued for patent infringement on a heel-burnishing machine by the Xpedite Company, and he told me that one of the conditions of settling the suit was his discontinuing our machines. He also gave the reason that he was violating his leases" (R. Vol. 1, p. 319, lines 35–41). Harriman was testifying on June 11, 1913 (R. Vol. 1, p. 317, line 42), so that this took place after the suit was begun.

The evidence of Herbert E. Chase, offered by the United States, as to his discontinuing the use of the Haverhill machines

was excluded on the ground that "the whole transaction was subsequent to the filing of this bill" (R. Vol. 1, p. 354, lines 15–32).

Mr. Winslow testified:—

> "W. S. Chase & Son, Haverhill, were using the Fox turn machine and the Pettengill heeler [both Haverhill Company machines]. We offered to let them return our turn machines and our heeling machines and to keep the lasting and metallic machines on the independent leases, but they decided to keep our machines and gave up the use of the Fox and Pettengill machines" (R. Vol. 1, p. 450, lines 27–32).

That is, the United Company did not insist that the Chase concern should use its turn machine and heeling machine, which they had agreed to use, but offered to cancel their leases of those machines and also offered to put on independent leases the lasting and metallic machines which they were using, so that the Chase concern would be free to use the United Company's lasting and metallic machines with the turn machine and the heeling machine of the Haverhill Company.

The Real Situation in respect to the Concerns about which Mr. Harriman testified.

Mr. Harriman produced a list entitled "Past and Present Users of Machines of the Haverhill Shoe Mchy. Co.," which is Plaintiff's Exhibit 161 (R. Vol. 4, p. 1118). All of the six concerns which Mr. Harriman testified about, including three named in the bill of particulars (*supra*, p. 792), are comprised in Group 1 of that list (pp. 1118, 1119). The list purports to state the machines of the United Company with which the machines of the Haverhill Company were used. Mr. Donham, secretary of the United Company, pointed out that "in no instance does the list show the fact that the lessee had the United Company's Goodyear auxiliary machines, or does it show the fact that the lessee had the United Company's general department machines which the lessee had elected to take

upon the lease plan instead of buying outright" (R. Vol. 1, p. 829, lines 11–16).

Mr. Donham then pointed out that in each of these instances the lessee had Goodyear auxiliary machines and that when he used those auxiliary machines with the Haverhill turn sewing machine he was using the United Company's machinery without making any payment for its use. Also in each of these instances the lessee had some of the General Department machines which instead of purchasing he had elected to take on lease, restricted to use with the United Company's welt and turn sewing machine. By using those machines with the Haverhill turn machines he was using them without proper compensation to the United Company (R. Vol. 1, p. 829, lines 17–33). Mr. Donham illustrated by enumerating the different kinds of machines held by Hilliard & Tabor (R. Vol. 1, p. 830, lines 1–11).

In fact Mr. Harriman admitted: "In most of the above instances *I knew I was asking the manufacturers to displace the United Company machines and use ours. I pointed out to many of them that taking our machines would be in violation of their leases from the United Company*, but that I did not think the leases valid and we would contest any suit" (italics ours) (R. Vol. 1, p. 324, lines 20–25).

The insignificance of the occurrences cited by Mr. Harriman, as well as those testified to by Pike (*infra*, pp. 797–798), even taking their testimony at its face value, is shown by the testimony of Webster, of the Haverhill Company, that "our machinery is being used side by side with the United machinery in thirty-eight factories, producing the same product. Sometimes a manufacturer will use our turn sewing machine and the United Company's heeling apparatus and sometimes he will use our heeling apparatus and the United Company's turn sewing machines, or will mix them up on some other plan" (R. Vol. 1, p. 299, lines 32–37).

(2) Testimony of Ned Pike, an Employee of the Haverhill Shoe Machinery Company.

Ned Pike, who installed machinery and solicited business for the Haverhill Shoe Machinery Company, testified that he met with serious difficulty in installing machines. He testified to his experiences in attempting to install machines with Ashe, Noyes & Small, Auburn, Maine, Dunn & McCarthy, Auburn, New York, Krippendorf & Dittman, Cincinnati, Syracuse Shoe Company, and Irving Drew Shoe Company, Portsmouth, Ohio. The effect of Pike's testimony was that each of these concerns refused to install the Haverhill Company's machines on account of the United Company's leases (R. Vol. 1, p. 329, lines 15–42).

Pike admitted that in each case that he testified about he solicited the business of the concern without having been sent for and that he suggested they take Haverhill Company machines to do the work already being done by United Company machines (R. Vol. 1, p. 330, lines 2–8, 26–35). Accordingly, as we have shown above (*supra*, p. 792), Pike was asking these concerns to substitute Haverhill Company machines for United Company machines for which they paid only as they used them and which they had agreed to use. If they did plead the leases as a reason for not taking his company's machines, it was a natural and proper thing to do.

But Nathaniel C. Small and Willard A. Noyes, of the Ashe, Noyes & Small Company, the only witnesses representing any of the five concerns named by Pike who testified regarding his alleged efforts to install machines, denied that any such statement was made to Pike as he claimed.

Nathaniel C. Small testified that he was treasurer of the Ashe, Noyes & Small Company and that Pike came and solicited his company to put in machines and talked with him. Small testified that he never made any such statement to Pike as Pike had testified. Pike had said, "they told me that under the leases of the United Company it would be impossible for them to install our machinery, unless they laid themselves open to a great deal of trouble—conflict with the United Com-

pany" (R. Vol. 1, p. 329, lines 24–27). Small further testified, "I did not make any statement to Mr. Pike which was at all to the effect that I would not put in his machines because of the existing leases with the United Company" (R. Vol. 1, p. 804, lines 3–16, 43–45).

Willard A. Noyes testified that he was a director of the Ashe, Noyes & Small Company and that he and Mr. Small were the active men in the concern. He said that no such statement as Pike claimed was made to Pike with his knowledge. While Pike was talking with Small, Noyes passed through the room and Pike showed him a picture of a turn sewing machine. Noyes glanced at the picture and asked what advantage the machine had, and one of the replies was that it was a non-royalty machine. Noyes said that did not interest him in the least; that the saving of royalty would not offset the value of the United Company to his concern. On cross-examination Noyes said: "In my conversation with Mr. Pike nothing was said about the leases which we had with the United Company. They were not mentioned" (R. Vol. 1, p. 805, line 18–p. 806, line 1).

It is significant that neither Charles H. Krippendorf, of the Krippendorf-Dittman Company, nor William F. Fowler, superintendent of the Krippendorf-Dittman factory, both of whom testified as witnesses for the United States (R. Vol. 1, pp. 214, 924), referred in any way to these alleged efforts of Pike to install Haverhill Company machines, or even mentioned the Haverhill Company. The United States did not call any witnesses representing the other concerns named by Pike.

Pike admitted that his concern was not in a position to furnish proper service to concerns which he solicited and that that question "usually comes up when we are trying to place our machines" (R. Vol. 1, p. 331, lines 21–41). That testimony alone furnishes an adequate reason for refusal of manufacturers to take his company's machines.

(3) Evidence Regarding the Union Lockstitch Machine.

(a) Testimony of Frank W. Merrick.

Frank W. Merrick, president of the Union Lock Stitch Company (R. Vol. 1, p. 199, lines 8–9), testified: "We tried to sell our machines to Mr. Jones, to Roberts, Johnson & Rand, Harsh and Edmands, and Peters Shoe Company, and could not sell them. Not all these transactions were by letter. Mr. Jones said the conditions in his leases of his other machines would not admit of his use of the machine and that he couldn't afford to touch it, because his leases forbade him. Roberts, Johnson & Rand gave the same answer" (R. Vol. 1, p. 203, lines 6–13).

Jackson Johnson (R. Vol. 1, p. 170) and Frank C. Rand (R. Vol. 1, p. 178), with whose firm the Peters Shoe Company had combined to form the International Shoe Company (R. Vol. 1, p. 162, lines 26–28; p. 171, lines 28–31), Charles H. Jones (R. Vol. 1, pp. 105, 951; Vol. 2, p. 2164), and George R. Harsh (R. Vol. 1, p. 195), all testified as witnesses for the United States, but *not one of them said a word about the Union lockstitch machine*, except Harsh who had taken and used it.

Furthermore, Merrick said Roberts, Johnson & Rand and the Peters Shoe Company *now have Union lockstitch machines* (R. Vol. 1, p. 208, lines 2–3). He also said his company had between 350 and 400 straight needle lockstitch machines out, all over the United States (R. Vol. 1, p. 199, lines 28–33).

(b) The Case of John E. Williams.

The testimony of John E. Williams, which related entirely to events which took place *after this suit was begun*, was introduced subject to defendants' objections and exceptions.

Williams testified that he was using United Company machines and that in August, 1912 (after this suit was begun in December, 1911), he installed a Union lockstitch machine in one of his factories and contemplated installing additional

machines in a new factory. He said that he talked with Mr. King of the United Company in November, 1912, and that Mr. King told him that the United Company felt that he had broken the obligation of his leases and would ask him to discontinue using the Union machine. At his request Mr. King submitted a plan by which he could use Union machines. Williams produced a memorandum which had been submitted to him at the time showing the initial payments which would be required if he substituted the Union machines for the United Company machines. Those additional payments for machines of four departments aggregated $3,675, and Williams testified that he understood that the memorandum also called for extra royalties on the pulling-over machine, the heel compressor, and the clicker, a total extra royalty of one and one-eighth cents per pair (R. Vol. 1, pp. 216–218).

On cross-examination Williams testified that the memorandum of initial charges referred to equipment to be furnished by the United Company for the new factory on the assumption that Williams would use the Union lockstitch machines there (R. Vol. 1, p. 218, lines 29–36).

Williams also said that he talked with Mr. King about the Union lockstitch machine which was already in his factory. He had the Goodyear lockstitch machine on a restricted lease on which he had paid no initial payment and on which the company received income only according as the machine was used. Putting in the Union machine would leave the Goodyear machine idle. Mr. King's final reply was that that would be in contravention of the leases; he said that with the initial premium form of lease they could use their Union machine as much as they wanted to. Williams also said that there was either no royalty on the clicker when used with the Goodyear Welter and Stitcher or the royalty was absorbed in the royalty paid upon the Stitcher (R. Vol. 1, pp. 218–219). So far as he knew the United Company had never had occasion before to fix a royalty on the clicking machine for use in making mock welts.

Williams further testified that he did not make any complaint to Mr. King about any restriction on the use of the Union machine but wanted to use it if he had a right to do so under the leases. He had an interest in the Boylston Manu-

facturing Company amounting to about $5,000 or $6,000 (R. Vol. 1, p. 221, lines 20–26).

Frederick G. King, manager of the United Company's Goodyear Department, testified that Williams' concern had a number of United Company machines under the restricted form of lease and that Williams inquired whether it was a violation of those leases to use the Union lockstitch machine with such machines of the United Company. King told him that it would violate some of the provisions of the leases, but offered to give him unrestricted leases under which he could do it. Williams decided not to use the Union machine, which he said he had put in for experimental trial (R. Vol. 1, p. 697, line 10–p. 698, line 16).

King further testified that the initial premiums stated in the memorandum which Williams testified about were the same as always charged to others on the independent form of lease and that the pulling-over machine royalty, which covered the use of the complete pulling-over system, was the regular rate. As to the heel compressor there would be no extra royalty if Williams compressed the heels in the factory in which he was making the shoes; Williams wanted to compress them somewhere else and sell them to this factory (R. Vol. 1, p. 698, lines 35–44; p. 699, lines 1–4).

Frank W. Merrick, president of the Union Lock Stitch Company, testified in June, 1913, that the Excelsior Shoe Company, Williams' concern, still had the Union machine, although they had not yet purchased it (R. Vol. 1, p. 199, lines 6–9, 42–44).

This testimony about the machines in Williams' factory amounts to no more than showing that the United Company was ready in this instance as always to make equitable terms with a manufacturer contemplating the use of a competitor's bottoming machine with the other bottoming machines of the United Company.

(4) The Merrick-Luitweiler Controversy.

The United States claimed that Mr. Winslow made threats to Messrs. Merrick and Luitweiler, president and treasurer of the Union Lock Stitch Company which was manufacturing a lockstitch machine (R. Vol. 1, p. 199, line 8 *et seq.*; p. 208, lines 17–18).

Frank W. Merrick testified that in the summer of 1905 he had a conversation with Mr. Winslow at the Touraine Hotel with reference to a sale of the business of the Union Lock Stitch Company, at which Mr. Winslow stated in effect that he would not allow Merrick and Luitweiler to make any money and that eventually their business would come around to him and he would take it (R. Vol. 1, p. 199, line 9; p. 200, line 21 *et seq.*). Luitweiler testified to the same effect (R. Vol. 1, p. 208).

Merrick testified under cross-examination that upon this occasion he could make no objection to Mr. Winslow's treatment of him, but that it was a "business bluff" (R. Vol. 1, p. 205, lines 35–42). He commented upon it as follows:—

> "I was not bluffed by what he said. It didn't influence my conduct. It might have frightened me a little. Up to that time the straight needle machine was the only thing we had developed. We have not been interfered with in marketing it except by ordinary methods of competition" (R. Vol. 1, p. 206, lines 11–15).

Taken at its face value, the testimony of the witnesses for the United States would show only that Mr. Winslow made the statement referred to as a "business bluff"; that it was recognized as a bluff; that it did not influence the conduct of Merrick; and that it was not followed up by any interference with Merrick's business.

Mr. Winslow, however, specifically denied ever making any such statement to either Merrick or Luitweiler (R. Vol. 1, pp. 517, 518), and all the probabilities of the case support this denial. Merrick claimed that Sampson, who was employed by the United Company, arranged the conference with Mr. Winslow (R. Vol. 1, p. 200, lines 21, 25, 26). It appears, how-

ever, that before the conference Merrick had asked a mutual friend, Mr. Buck, to bring Sampson to him, had invited Sampson aboard his yacht and had taken him to the Hull Yacht Club as his guest. When Merrick had Sampson out on the yacht he talked with him about his (Merrick's) company and the enterprise in which he was engaged (R. Vol. 1, p. 204, lines 5–23). Merrick's machines were then in an experimental state, and Merrick testified: "We didn't get anywhere with Sampson. He didn't have anything to say" (R. Vol. 1, p. 204, lines 23–27).

Sampson testified that Mr. Buck called on him, showed him a sample of stitching and said it was done on a new machine which Merrick had brought out; that Merrick had several machines he would like to sell and would like to get employment with the United Company. Within a few days, Buck came and invited Sampson off on Merrick's yacht. Sampson declined to go and Buck came back a few days later and urged him to go. While on the yacht Luitweiler asked if he could meet Mr. Wilson, general manager of the company, and pursuant to this request the meeting with Mr. Winlsow came about (R. Vol. 1, pp. 615, 616).

Both Merrick and Luitweiler admitted that at a later interview Mr. Connor of the United Company stated positively that he would not consider buying their business on a competitive basis (R. Vol. 1, p. 210, lines 2–5). It seems quite obvious what sort of solicitation on the part of Merrick and Luitweiler would have called forth such a statement on the part of Connor.

Mr. Connor's attitude is shown by the testimony of Edwin P. Brown, then general manager of the United Company, who testified that he was present at an interview which Merrick and Luitweiler had with Mr. Connor and that Mr. Connor said to them, "'If you care to have me look into it, I should be glad to do so, but I want you to understand that we wouldn't consider it for a minute, otherwise than on its merits, only in so far as it is an improvement over anything that we have or is something that we can use advantageously for our lessees'" (R. Vol. 1, p. 718, lines 28–33).

In respect to this charge the District Court found as follows:—

"Mr. Winslow is also charged, in testimony given by Merrick and Luitweiler, president and treasurer of the Union Lock Stitch Company, then developing machines not yet put on the market, with having told them in 1905, while attempting to persuade them to sell out to the defendants, that they would not be allowed to make any money; that the United Company would build their machines; that their business would come round to it and be taken by it, and that it was cheaper to kill competitors than to acquire them. The alleged statements are denied by Winslow. The business referred to is one never acquired by the defendants, nor is any interference whatever with this business shown. This was admitted, and the testimony of the two witnesses named is that they have put out 350 to 400 of the machines in question" (Dodge, J., R. Vol. 1, p. 1149, lines 1–13).

C. FINDING OF THE DISTRICT COURT AS TO THE ALLEGED "THREATS AND INTIMIDATIONS" BY DEFENDANTS.

The District Court said (R. Vol. 1, pp. 1147–8):—

"It remains to consider how far the evidence proves the defendants to have used 'threats and intimidations' of the various kinds described in the petition. . As to far the greater part of the specified instances set forth in the bill of particulars, the charges of this kind have been allowed to go wholly without attempt at proof. Of those regarding which any such attempt was made, six only have been insisted upon in the petitioner's briefs or argument. No reason whatever to believe that any greater significance could be claimed for any others of the specified instances than for these appears from the evidence regarding them to be found in the record."

The Court then reviewed the evidence regarding the six alleged instances which were insisted upon in the District Court (R. Vol. 1, pp. 1148–9), and concluded (R. Vol. 1, p. 1150):—

"It thus seems clear that nothing proved as to the above instances of so-called 'threats and intimidations' is sufficient to justify such allegations as are made in paragraph VI of the petition about them. Even if anything said by a representative of the United Company on these occasions can properly be called a 'threat,' in view of all the surrounding circumstances shown, there is certainly no adequate reason established for believing that any competitor's customers have been induced to abandon them, or that anybody has been prevented from attempting competition by what was said. The instances relied on are widely separate in time and distinct as to circumstances and persons. They cannot reasonably be regarded as showing a concerted purpose to suppress competition through intimidation, such as paragraph VI purports to charge. In every instance the expressions said to have been used by a representative of the United Company were in interviews with persons interested in some concern or machine which the United Company was asked or might be asked to buy. As has appeared, propositions of this kind were constantly being made to its representatives, and many more of them were refused than were accepted."

D. FINDING OF THE DISTRICT COURT AS TO THE CHARGE THAT PROVISIONS OF THE LEASES HAVE BEEN ARBITRARILY ENFORCED.

The District Court said (R. Vol. 1, pp. 1150–1):—

"Not in paragraph VI, but in the preceding paragraph V of the petition, the charge is made that certain provisions of the leases, under which the United Company's machines have been operated by users, have been arbitrarily enforced, in pursuance of a general policy and practice to refuse machines for failure to comply with the terms and spirit of the leases 'and to otherwise injure' users so failing to comply.

"In the above bill of particulars filed, as has been said, on June 25, 1913, 'in amplification of Section VI of the petition,' the defendants are charged, in a number of specified instances, with threatening to remove or remov-

ing machines from the factories of users because competing machines or machines obtained from other concerns were also being there used or because such use of other machines was in contemplation. No proof whatever has been offered as to a considerable proportion of the instances thus specified.

"In the instances specified regarding which there is some proof nothing more is shown than that the United Company insisted, to a greater or less extent, upon observance by the lessee of provisions in his lease to which he had expressly agreed when he took the machine, and which he was purposely violating or proposing to violate to the detriment of the lessor, because such violation would tend to decrease the number of pairs of shoes operated on by the machine and thus the royalty to be paid for its use by the lessee.

"If the provisions referred to in the leases are contrary to law, it was unlawful to insist upon them. The question here involved is later considered. But unless the provisions were unlawful, the evidence regarding these specified instances in which their observance was insisted upon wholly fails to show that in any instance the defendants did or attempted anything whereof either the lessee of the machine or anyone else had any right to complain.

"It may be said generally that the instances in which machines were in fact removed from the factories of lessees under the provisions referred to have been so few in proportion to the total number of leases as to leave the general charge that such provisions have been arbitrarily or oppressively enforced destitute of any sufficient foundation. Only five such cases appear in the evidence. In each the lessee's conduct was in wilful disregard of the lease agreements and afforded a complete justification for the lessor's action, unless none is possible."

In concluding its discussion of the charges of alleged unfair and oppressive acts the District Court said (R. Vol. 1, pp. 1152–3):—

"The history of the proceedings in this case indicates that efforts which may fairly be described as extraordinary have been made to bring before the court, so far as possible, all sayings or doings of any of the numerous defendants or their representatives, during the period beginning with 1899 and ending with 1911, which might afford ground for charging them with oppressive, coer-

cive, or like unfair conduct toward competitors of the United Company or the public. In view of the long period and wide fields thus searched, the numerous abandoned attempts to prove something of the kind above indicated, and the insignificant result of the evidence actually offered and finally relied on, the conclusion seems fully justified that the policy and methods pursued by the defendants and by the United Company have been, in general, above reproach in any of these respects."

APPENDIX III.

TESTIMONY OF COMPETING SHOE MACHINERY MANUFACTURERS CALLED BY THE UNITED STATES AS TO CONCERNS COMPETING WITH THE UNITED COMPANY.

ALPHABETICAL INDEX OF CONCERNS.

	PAGE
American Worsted Machinery Company	833
Atlas Tack Company	833
Atlas Works	818
Barber, L. L., & Company	822
Beckman Machine Company	828

Victor Shoe Machinery Company 823
Wheeler, J. S., & Company 822
Young, W. J., Machinery Company 831

THE TESTIMONY OF COMPETING SHOE MACHINERY MANUFACTURERS AND THEIR REPRESENTATIVES, CALLED BY THE UNITED STATES IN PRESENTING ITS DIRECT CASE, PROVES THAT THERE ARE MANY AND SUBSTANTIAL CONCERNS OTHER THAN THE UNITED COMPANY ACTUALLY FURNISHING SHOE MANUFACTURERS WITH MACHINES.

In addition to the evidence which the defendants introduced, including various exhibits, catalogues of shoe machinery manufacturers, etc., as well as the testimony of Mr. Winslow, the following testimony was given by witnesses for the United States establishing the fact that a large number of concerns in addition to the United Company are, in fact, in the market supplying shoe machinery to the trade.

Duplessis Shoe Machinery Company.

Hamel Shoe Machinery Company.

Chas. A. Hamel, vice-president of the Hamel Shoe Machinery Company, the successor of the Duplessis Shoe Machinery Company, testified that the Duplessis Company began business at Haverhill in 1903 and it and Hamel, as its successor, have carried on business since without interruption, having sold in the United States twenty or more types of machines used for bottoming shoes to the extent of between 400 and 450 separate machines, not counting the practically equal number sold abroad, and including 86 welt and turn machines, 41 stitchers, 70 insole channelers, 24 loose nailers, and 22 sluggers (R. Vol. 1, p. 326). Hamel named four shoe machinery concerns which the Hamel Company had taken over and stated that that company manufactured at Haverhill, in addition to the machines made at Lynn, ten different types of machines, including welt and turn sewing machines and outsole lock-

stitch machines and also leveling, molding, and various metallic fastening machines. He said that his concern employs "from sixty to sixty-five men at both our shops" (R. Vol. 1, p. 944, lines 44–45; p. 945, lines 1–42). Summing up, he said: "We have a complete set of machines for making turn shoes and a complete set of machines for making welt shoes"; also "a complete set of metallic fastening machines for either a welt or McKay shoe" (R. Vol. 1, p. 327, lines 15–19).

Hamel testified that Mr. Sullivan of the Singer Sewing Machine Company had become the treasurer of the Hamel Company (R. Vol. 1, p. 945, lines 34–40).

Thomas C. Rowen, the president of the Hamel Company, named a dozen types of machines, including buffing, breasting and scouring machines, manufactured at Lynn where he said "thirty-five or forty men" were employed and added that "our principal business is with shoe manufacturers. We do not do any business with shoe repair men" (R. Vol. 1, p. 946, lines 2–20).

Catalogues of both the Duplessis and Hamel Companies are contained in Defendants' Physical Exhibit 321 and either Mr. Hamel or Mr. Rowen testified to manufacturing each of the machines appearing in the Hamel catalog (R. Vol. 1, p. 946, lines 21–26).

Haverhill Shoe Machinery Company.

Edwin A. Webster, an inventor, and a director of the Haverhill Shoe Machinery Company, connected therewith since its formation in 1907, testified:—

> "The Haverhill Shoe Machinery Company manufactures turn channel machines for turn soles, welt innersole lip turner, welt groover and beveler, welt beaters, turn sewers and welters, heel-nailing machines, heel-attaching machines, heel-trimming machines, heel-seat keying machines, keyer or beader, and turned sole-molding machines" (R. Vol. 1, p. 291, lines 1–6);

also "heel breasting machines." "We handle but do not build the Webster leveler" (R. Vol. 1, p. 298, line 42; p. 299, lines 2–3). He testified further that his company were agents

for lasting machines, rapid outsole stitchers, loose nailers and sluggers—metallic fastening machines. "We handle the Hamel machine for slugging heels and one turn machine." Some lasting and slugging machines are obtained from Gimson & Company and the Standard Rotary Company, of England (R. Vol. 1, p. 298, lines 1–10, 44–45; p. 300, lines 40–45; p. 301, lines 1–3).

In discussing certain of these machines more in detail, Mr. Webster testified that the Haverhill Company had put on the market 25 heel nailing machines ("Pettingill" type—R. Vol. 1, p. 302, lines 1–2), 65 welt and turn machines, and 60 or 65 turn channeling machines with 12 to 15 in stock. He admitted that the turn molding machine, of which they had put out 40 or 50, is "a copy of the Goodyear machine" and that their turn channeling machine and welt innersole turner and welt beater correspond to machines put out by the United Company "for performing the same kind of work" (R. Vol. 1, pp. 291–292).

Summarizing, he said: "We have machines with fifty-eight manufacturers, of whom thirty-eight also use United machines" side by side with Haverhill machines (R. Vol. 1, p. 299, lines 5–7, 32–45).

> "We advertise that we furnish any manufacturer a full line of all kinds of shoe machinery, whether it is for welts or McKays, or turns or pegs or anything else. We are prepared to make good if our people that manufacture machines don't go back on us" (R. Vol. 1, p. 301, lines 5–9; see also p. 298, lines 13–15).

Mr. Louis H. Harriman, treasurer of the Haverhill Company and having "general oversight of its business" (R. Vol. 1, p. 317, line 45; p. 318, lines 2–3), furnished a long list comprising five different groups of "Past and Present Users of Machines of the Haverhill Shoe Mchy. Co." In connection with the machines sold to the Criterion Shoe Co., Beverly, Mass., the list contains this note: "A line of Welt machinery independent of U. S. M. Co. including Welter from Haverhill Co." (P.'s Ex. 161, R. Vol. 4, pp. 1118–1122).

R. H. Long Machinery Company.

Richard H. Long, treasurer of the R. H. Long Machinery Company (R. Vol. 2, p. 2135, Cr. Ints. 51–53), testified,—

> "We manufacture machines for lasting and welting and stitching—sole stitching—leveling, heeling, some metallic fastening machines, and a number of others" (R. Vol. 1, p. 232, lines 4–6),

comprising fifty types in all, for the manufacture of welt shoes (R. Vol. 1, p. 271, lines 10–15); Defs.' Physical Exs. 72, 73, *i.e.*, catalog of the Long Company). Among the machines which he had actually sold he named "sole welting, stitching, some metallic machines" bought by "Mr. Taylor, of the Taylor Shoe Company, of Lynn," who is using no machinery of the United Company (R. Vol. 1, p. 232, lines 23–31).

Long stated that he had sold fifty to one hundred welters, stitchers "and some other machines" "to shoe manufacturers," in addition to machines sold "to cobblers—shoe repairers" (R. Vol. 1, p. 233, lines 8–14). He stated further that he had on hand three or four hundred "rapid outsole lock-stitch machines," briefly referred to as stitchers, thirty or forty welting machines, twenty to twenty-five or more lasting machines and three or four heeling machines, not including metallic fastening machines being built and not including machines which he was actually using in his own factory (R. Vol. 1, p. 274, lines 36–45; p. 275, lines 1–5).

Long stated that since 1907, when he fitted up his own factory with machines procured from concerns other than the United Company, he had been making shoes entirely without United Company machines (R. Vol. 1, p. 231, lines 23–43; p. 232, lines 7–13), his daily capacity being "five or six thousand pairs . . . almost exclusively" welts (R. Vol. 1, p. 224, lines 39–44).

John J. Doidge, general manager of the Long Company, testifying a week later, confirmed generally the above statements of Mr. Long, but stated, "We have practically completed four hundred and fifty out-sole stitching machines"—

copied exactly, except for patented parts, from the old Goodyear machines (R. Vol. 1, p. 345, lines 6–14, 39–40). This is a larger number than that set by Long. Among the many other machines which Doidge named as being made by the Long Company were innersole and outersole machines, welt machines, sole laying and leveling machines, heeling and lasting machines. He said:

> "We do not make all the machines shown in our catalogue. We are getting ready to make about all. Some auxiliary machines we buy from others. We have had as many as seventy-five employees, at present about eighteen. There are three buildings to our factory" (R. Vol. 1, p. 346, lines 16–20).

And he summed up with the statement: "We are ready to supply a full line of machinery for welt and turn shoes and we so advertise" (R. Vol. 1, p. 345, lines 43–44; Defs.' Physical Exs. 72, 73).

Boylston Manufacturing Company.

George W. Maloy of Boston, who has for five or six years been "in charge of the sales department of the Boylston Manufacturing Company," testified:—

> "We make power treeing machines, hand treeing stand, Julian rounder, Union edge setter, Webster buffer, Webster cleaner, Globe heel scourer, heel-finishing machine of hot wax type, and heel-blacking machine. That is all. The heel-blacking machine and the heel-finishing machine have been put out recently. They are adapted to all kinds of shoes. They are sold outright, except the power treers which are put out on royalty. Many are sold to customers of the United Company all over the country, I suppose" (R. Vol. 1, p. 302, lines 16–25).
>
> "We have placed bottoming machines in the factories on trial but never tried to sell or lease any. We placed them in our own factory at Fair Haven and in a factory at Pepperell run by the Buffalo Shoe Company" (R. Vol. 1, p. 301, lines 29–32).

Mr. Maloy affirmed that "we are offering all of the machinery named in" the Boylston catalogue (R. Vol. 1, p. 302, lines 38–39; Defs.' Physical Ex. 76).

From his knowledge as to parties making shoe machinery in the United States, he further testified:—

> "Welting machines are put out by the Hamel Shoe Machinery Company, of Haverhill, the Haverhill Shoe Machinery Company, R. H. Long Company, of South Framingham, Champion Shoe Machinery Company, of St. Louis, and Victor Shoe Machinery Company, of Boston. I believe the two last confine their business to repairers and do not furnish machines to shoe makers. Outsole stitchers are made by R. H. Long & Company and Union Lockstitch Company of East Boston. . . . The Haverhill Shoe Machinery Company puts out the Pettingill heeler. . . . Long has a loose nailer" (R. Vol. 1, p. 301, lines 35–43; p. 302, lines 1–3).

John F. Cavanaugh of Ashland, Mass., "salesman of shoe machinery connected with the Boylston Manufacturing Company," which had taken over the Flagg Manufacturing Company in 1904, and called by the United States in rebuttal, testified that the Boylston Company had put out lasting, pulling-over, slugging and heel finishing or blacking machines, referring specifically to about forty heel-finishing machines which had been placed in five localities, east and west. He also mentioned a large number of foreign concerns in the shoe machinery business including several "good-sized concerns" some of which "manufacture complete lines of shoe machinery" and at least two of which, he stated, were "ready to do business in the United States" (R. Vol. 1, pp. 954–7).

Charles S. Johnson of Lynn, now connected with the Boylston Manufacturing Company, testified that it absorbed the Tripp Giant Leveler Company in 1905 and that the Tripp Company "made several types of levelers for leveling the bottoms of shoes of all kinds." "We had several machines; direct pressure leveler; rolling pressure leveler, called Giant leveler; and an improvement on it, the new Giant leveler. Our new Giant leveler sold for $350" (R. Vol. 1, p. 304, lines 29–33; p. 305, lines 6–9, 14–20).

F. A. Brackett, formerly employed by the Boylston Manufacturing Company at Fairhaven, testified: "They had two welting machines which were manufactured by the Boylston Manufacturing Company." "We had no machines obtained from the United Company. We got them all elsewhere, and we made welt shoes without any machines from the United Company" (R. Vol. 1, p. 951, lines 11–18, 29–32).

Harrie A. Ballard testified that he had gotten out a stitching machine and a welt machine which had been used in 1907 at Fairhaven (R. Vol. 1, p. 958, lines 3–4, 35–40).

Jackson Johnson, a member of the "Shoe Manufacturers' Alliance" and president of the International Shoe Company, which is financially interested in the Boylston Company, testified that the "Boylston Company contemplates making a full line of shoe machines" (R. Vol. 1, p. 170, lines 31–35; p. 171, lines 19–23).

Union Lock Stitch Company.

Frank W. Merrick of Boston, president of the Union Lock Stitch Company, testified:—

> "That company is located in East Boston and manufactures shoe machinery. We manufacture a straight needle lock-stitch machine for saddlery and shoe work and a curved-needle stitching machine for shoe work. We make a lock-stitch welt machine, a sole-fitting machine, lasting machines, and two metallic fastening machines, used in connection with lasting operations. I have been building shoe machinery for thirty-two years, mostly stitching machinery. I have built the Merrick stitching machine, used almost exclusively on upper fitting; the Puritan machine, used both on upper fitting and sole stitching and also harness and saddlery work; and a small chain-stitch machine, called the Rapid machine, for a similar class of work. After that I followed with the lock-stitch harness machine, which is a straight needle, waxed-thread stitching machine that can be used for certain kinds of sole stitching, and then with the curved-needle machine, designed expressly for stitching outsoles, both welted and McKay welt and McKay fair stitch shoes. It will do fair stitching on any type of shoe. At present we are putting the straight-needle lock-

stitch machine on the market. We have between three hundred and fifty and four hundred lock-stitch machines out. We first engaged in the manufacture of the lock-stitch machine in 1904. We sell those machines outright at seven hundred and fifty dollars, five off in thirty days. The machines are all over the United States. About seventy-five of the straight-needle machines are in shoe factories and the balance were placed among harness and saddlery people. We are attempting to market the curved-needle machines, of which three have been sold to shoe factories" (R. Vol. 1, p. 199, lines 9–37).

One other has been sold while three others have been completed and a dozen nearly assembled (R. Vol. 1, p. 199, lines 39–40; p. 207, lines 5–6).

"Our straight-needle machine was ready for the market about 1907, the curved-needle machine about 1909. . . .

"The United Company has a curved-needle machine for doing similar work to ours. The Campbell-Bosworth Company has a machine for doing work similar to our straight-needle machine" (R. Vol. 1, p. 201, lines 13–20).

Geo. R. Harsh of Milwaukee, a shoe manufacturer, testified: "We formerly used the Goodyear out-sole stitcher to stitch the two soles of a nailed shoe together before nailing them to the upper. We substituted the Union lock-stitch machine for that operation." "The Union lock-stitch machine is better and more rapid for that purpose" (R. Vol. 1, p. 195, lines 34–37; lines 23–34). Other shoe manufacturers referred to this machine (see R. Vol. 1, p. 160, lines 14–15; p. 216, lines 39–40).

Peerless Machinery Company.

Lorenze Muther of Newton testified that the Peerless Machinery Company—

"manufactures shoe machinery, principally what is called stitching-room machinery; *i.e.*, eyelet-setting machines, skiving machines, hook-setting machines, perforating machines, sanding machines, pasting machines, cementing machines, folding machines, button-sewing machines, and a tip press belonging to the finishing-room depart-

ment of the factory. We have both tip press and tip perforating machines. Similar machines are put out and sold outright by the general department of the United Company" (R. Vol. 1, p. 303, lines 1–12).

"Our machines relate to work on uppers of shoes, except the sanding machine which finishes or roughs the sole before it is put on the shoe. . . . We publish a catalogue" (R. Vol. 1, p. 303, lines 23–27).

He referred to different concerns making eyelets and particularly to the Atlas Tack Company which "makes various kinds of eyelets for shoes," stating:—

"We sell more Atlas than United eyelets, and our customers are altogether shoe manufacturers. . . . Our machines are sold to shoe manufacturers who use other machines obtained from the United Company. That company has machines for performing similar operations. Our machines and theirs are sometimes used side by side in the same factory" (R. Vol. 1, p. 303, lines 15–17; p. 304, lines 2–7, 10–13).

George Knight testified:—

"The Peerless Company is making and supplying the eyeletting machines, which we formerly made, in quite large quantities. They are used by shoe manufacturers" (R. Vol. 1, p. 903, lines 37–39).

Atlas Works.

Alex Stone of New York, formerly "export manager for the Atlas Works at Leipsic, Germany," testified:—

"My concern makes a complete line of shoe machinery, including welters and stitchers, heeling machines and lasting machines." "They are prepared to furnish a complete line of shoe machinery for welt, McKay, and turn shoes." "The Atlas factory employs three hundred men in Leipsic. It has a capacity of three of each of the principal machines a week, so that each week they could furnish three equipments" (R. Vol. 1, p. 339, lines 40–44; p. 340, lines 9–11; p. 342, lines 8–9; p. 343, lines 41–43).

"I first attempted to install machinery for the Atlas

Works in this country in December, 1910." "I offered to equip the Roberts, Johnson & Rand factory with a complete equipment for McKay, welt, and turn shoes, except a few minor machines" which could be bought from "other people." "I offered to equip the Hamilton-Brown Company with our full line. I offered to sell the machines outright" (R. Vol. 1, p. 340, lines 3–9; p. 342, lines 16–20, 43–44; p. 343, lines 1–2).

"I sold machines to nail wooden heels on shoes of the turn variety to Evans in Wakefield, and Guptil in Haverhill. Those were the only two machines I sold in the six weeks I was here" (R. Vol. 1, p. 341, lines 21–23).

An Atlas catalogue will be found as Defendants' Physical Exhibit 319.

Seelye Manufacturing Company.

Nelson H. Seelye of Winchester, Mass., testified that he manufactures—

"machines which, used in connection with dies, cut out material such as leather, cloth, rubber, etc. I have been in that business since 1889. The company was first called the Hawkins Machinery Company [later becoming the Seelye Manufacturing Company (Defs.' Ex. 336, R. Vol. 5, p. 891)] and made beam die presses or dinking machines for dieing out the soles of shoes, among other things. The machine for cutting the upper is the clicking machine. We were engaged in that business when the United Company was formed. We sold from fifty to one hundred per year to shoe manufacturers up to that time. We continued to place on the market our machines after the formation of the United Company" (R. Vol. 1, p. 327, lines 30–40).

"The United Company offered its machines for sale at the same price as ours, and it also offered them on an annual rental of fifteen dollars. We never tried to rent any of our machines, but adhered to our old plan of one basis, sale only" (R. Vol. 1, p. 328, lines 18–21).

THE TESTIMONY OF COMPETING SHOE MACHINERY MANUFACTURERS, CALLED BY THE UNITED STATES IN REBUTTAL, PROVES THAT THERE ARE IN THE FIELD MANY CONCERNS ACTUALLY BUILDING AND PUTTING OUT SHOE MACHINERY IN COMPETITION WITH THE UNITED COMPANY.

Among the large number of shoe machinery manufacturers and dealers who testified for the United States in rebuttal the testimony of the following will now be referred to briefly, and for convenience they will be taken up, as a rule, in the order in which their testimony appears in the record since they were called at about the same time and in reply to the testimony of William R. Sampson, witness for defendants, who produced, in addition to a number of loose catalogues (Defs.' Physical Exs. 312–320), two large portfolios, one of which (Defs.' Physical Ex. 321)—

> "comprises letters, catalogues, and advertisements of different machines that are offered for sale and advertised in this country by manufacturers of shoe machinery. There are 116 manufacturers represented. . . . All of these concerns are still engaged in business" (R. Vol. 1, p. 836, lines 33–42).

The other portfolio (Defs.' Physical Ex. 311) comprises additional catalogues of competing shoe machinery manufacturers (R. Vol. 1, p. 836, lines 43–44; p. 837, lines 1–3). All of these exhibits are indexed in Defs.' Ex. 336, R. Vol. 5, pp. 849–905. In the same connection, Mr. Sampson furnished a "list of machines offered by shoe machinery manufacturers and dealers other than United Shoe Machinery Company for preparing and attaching the bottoms to the uppers of shoes, eyeletting machines, dieing-out machines and clicking machines" (Defs.' Ex. 337, R. Vol. 5, pp. 906–935).

As we shall now proceed to point out in detail, practically

all of the machines of the manufacturers and dealers referred to below are in competition with similar machines of the United Company.

Edwin B. Stimpson & Son.

Edwin B. Stimpson of Brooklyn, a manufacturer of machinery for forty years, testified: "we can supply strip cutters" which can be used "to cut strips of welt" (R. Vol. 1, p. 882, line 38; p. 884, lines 3–12). Other witnesses testified that "by an adjustment of the knives" a strip cutter can "be converted into a machine for flexing, and it has been so used. It is sometimes known as an insole flexer" (R. Vol. 1, p. 885, lines 43–44; p. 886, line 1; p. 890, lines 23–25). Stimpson finally stated that the only machines "which I have placed with shoe manufacturers within the last five years are the pinking and perforating machines, which are used for ornamental perforations" (R. Vol. 1, p. 884, lines 15–19).

All of these machines are in direct competition with machines of the United Company (Defs.' Exs. 227, 232, R. Vol. 5, pp. 425, 426, 482, 483, 498).

Edward E. Spencer & Company.

Edward E. Spencer, Jr., of New York testified that the Spencer Company did a business in shoe machinery and accessories, building "channeling, rolling, splitting, impression stitch, buffing, and eyeletting machines"; also strip cutters (R. Vol. 1, p. 885, lines 1–6).

Mr. Spencer also testified that "John D. Randall & Company of Cincinnati put out machines for harness trade. The only machines put out by them which could be used in the shoe trade were strip cutters" (R. Vol. 1, p. 885, lines 17–19).

All of these machines are in direct competition with machines of the United Company (Defs.' Exs. 227, 228, 246, R. Vol. 5, pp. 425, 437, 684, 685, 689).

L. L. Barber & Company.

William L. Barber testified that his father had been in "business continuously" from 1859 to 1911, the name of the concern being L. L. Barber & Company.

> "The machines which we made which could be used in the manufacture of shoes were presses, dies for perforating toe caps, and perforating machines for perforating uppers, and some smaller attachments which were used upon Singer sewing machines for stitching uppers" (R. Vol. 1, p. 887, lines 7–26).

The United Company also puts out machines of these several classes with the exception of the attachment for the Singer machine (Defs.' Exs. 227, 232, 246, R. Vol. 5, pp. 427, 482, 483, 687).

Leslie L. Hartwell.

Leslie L. Hartwell of Revere, superintendent for A. G. Walton & Company, testified: "I have put out a few machines which can be used in manufacturing shoes. They were a grooving machine, a sanding machine, a heel-building machine, and a counter-dividing machine." "Each of my machines had something to do with the bottom before it was attached to the upper." "I made some of the heel-building machines for our own concern and then sold the rights to manufacture them to the Young Machinery Company." "The machine is used by heel manufacturers, and by shoe manufacturers who make their heels. It is the universal heel-building machine today" (R. Vol. 1, p. 887, lines 43–44; p. 888, lines 1–27).

All of the machines above mentioned are in direct competition with machines of the United Company (Defs.' Exs. 227, 228, 232, 246, R. Vol. 5, pp. 426, 434, 508, 685, 688).

J. S. Wheeler & Company.

Joshua S. Wheeler of Winthrop, "principal owner of the business of J. S. Wheeler & Company," testified that that

concern makes welt cutting, counter-dividing and other new machines. "We also rebuild shoe machinery" such as "vamp machines," "sole cutters," "National stitchers" and "Puritan stitchers" (R. Vol. 1, p. 889, lines 42–44; p. 890, lines 1–17).

All of these machines are in direct competition with machines of the United Company (Defs.' Exs. 227, 228, 232, R. Vol. 5, pp. 425, 426, 435, 526; also Vol. 2, p. 2244).

Puritan Manufacturing Company.

John H. Lingley of Brockton, manager of the Puritan Mfg. Company, after mentioning a half-dozen types of machines sold by his company, said:

> "Our welt-seaming machine attaches a McKay welt to the sole before it is laid. Our Puritan fair-stitching machine and our vamp-welt-seaming machine are used in the operation of attaching the sole to the upper. All the machines mentioned are sold to shoe manufacturers" (R. Vol. 1, p. 892, lines 4–9).
>
> "We sell a good many Puritan fair-stitch machines, and have probably sold around a thousand since we first went into business in 1892 or 1894" (R. Vol. 1, p. 891, lines 36–38).

The stitchers which the United Company puts out in the Goodyear Department compete with these machines of the Puritan Company in attaching soles to welts (Defs.' Exs. 228, 232, 235, R. Vol. 5, pp. 439, 505, 556).

Victor Shoe Machinery Company.

L. E. Johnson, of the Victor Company, testified that in four or five months they have delivered "thirty-two lock-stitch machines to small shoe manufacturers" (R. Vol. 1, p. 893, line 24).

> "We have been putting out a rough rounder and channeler longer than that. It is a machine intended to perform an operation on the sole of a shoe, for completing the work of attaching the sole to the upper" (R. Vol. 1, p. 894, lines 6–12).

He referred to five or six other machines put out by his company and some similar machines put out by the Champion Shoe Machinery Company or the Universal Shoe Machinery Company and the Specialty Shoe Machinery Company, all of Missouri. Some of these machines were intended for the "repair trade," but some were for the "shoe factory trade" and "could be used on a new shoe" (R. Vol. 1, pp. 893–895). Among the machines put out by these companies, he mentioned "a lock-stitch machine" and "a welt machine" (R. Vol. 1, p. 893, lines 40–42; see also p. 921, lines 17–22).

All of these machines are in direct competition with machines of the United Company (Defs.' Ex. 232, R. Vol. 5, pp. 512, 513, 515, 516).

George Knight & Company.

George Knight of Brockton stated that his concern had "put out a power gang eyeletting machine" and also makes—

> "tip-perforating presses (models E, F, & G), hand, foot, and power tip-punching machines, vamp creasers, feather edgers, lip turners, and K and K cementing machines. We do make all of these. We have made heel shaving, lining sticking, and heel building machines in the [about 29] years I have been in business" (R. Vol. 1, p. 902, lines 40–41; p. 903, lines 28–33).

The United Company puts out machines in direct competition with all of these Knight machines (Defs.' Exs. 227, 228, 232, 235, 246, R. Vol. 5, pp. 427, 431, 483, 494, 497, 498, 500, 503, 527, 634, 684).

Kimball Brothers & Sprague.

Fred S. Sprague, of Kimball Brothers & Sprague, Brockton, testified that they "make a welt laying machine" and "sell it to shoe manufacturers" (R. Vol. 1, p. 904, lines 1–7).

The United Company has two competing models of welt laying machine (Defs.' Ex. 232, R. Vol. 5, p. 507).

Thomas Bostock.

Thomas Bostock of Brockton named ten different machines which he was—

> "making right along," each performing "an operation which is either preparing or finishing the bottom of the shoe before or after it is attached to the upper, or getting the upper ready for attachment to the sole" (R. Vol. 1, p. 905).
>
> "We have put out as many as one hundred heel building machines a year," mostly to shoe manufacturers (R. Vol. 1, p. 904, lines 42–43; p. 905, lines 36–40).

• The machines which he named comprise, in addition to the heel building machine, a toe softener, a heel lift gouger, a cap (tap) cutter, a spring heel scarfer, a rand turner, a rand chopper, a welt slasher, a rand cutter, and a box toe press.

The United Company has machines which directly compete with practically all of these Bostock machines (Defs.' Ex. 232, R. Vol. 5, pp. 497, 498, 504–510).

Carlson Brothers.

Carl A. Carlson of Brockton testified: "We make a toe softening machine used for softening the box of the shoe before it is lasted. . . . They are used altogether by shoe manufacturers" (R. Vol. 1, p. 906, lines 1–7).

The United Company puts out a machine for the same purpose (Defs.' Ex. 232, R. Vol. 5, pp. 509, 510).

Albert G. Brewer.

Albert G. Brewer of Natick testified, "I make a McKay welt-slashing machine, which I sell to shoe manufacturers" (R. Vol. 1, p. 907, lines 13–16).

The United Company puts out a machine for the same purpose (Defs.' Ex. 232, R. Vol. 5, p. 506).

Tower Brothers.

John M. Tower of Tower Bros., Hudson, Mass., named eight machines made and put out by his concern which "all have to do with finishing the sole or the heel after it is attached to the upper" and also two more "for dieing out the sole."

The names of these ten machines as given by Mr. Tower follow: "high-speed buffer, beveling machine, edge trimmer, edge scourer, stamping machine, heel trimmer, rotary edge setter, power stripping machine," "vamp cutter," "dieing-out" machine (R. Vol. 1, p. 908, lines 10–17).

All of these machines are in direct competition with machines of the United Company (Defs.' Exs. 228, 232, R. Vol. 5, pp. 434, 480, 481, 496, 501, 521–526).

J. S. Holt Co. (Inc.).

John Bulmer of Boston, superintendent of the Holt Company, testified that his "company is engaged in the business of second-hand shoe machinery." He stated we "rebuild" McKay sewing machines (R. Vol. 1, p. 908, lines 19–41).

The United Company is one of the many concerns putting out McKay sewing machines (R. Vol. 1, p. 858, lines 35–45; p. 859, lines 1–21).

Union Special Machine Company.

Alonzo H. Hatch, New England manager for the Union Special Machine Company, stated that most of his company's machines were used "for performing operations for preparing the upper for the lasting operation," but that they had an "overedge machine" and a "butting machine" "used for preparing an imitation Gem insole" and that they had "fitted up one machine especially for making a corded welt" (R. Vol. 1, p. 909, lines 25–37; p. 910, lines 8–10).

While the United Company does not compete with the Union Special Company with respect to machines for sewing uppers, it does have various machines for preparing Gem insoles and for making welts (R. Vol. 2, pp. 2243, 2247).

Shawmut Machinery Company.

Frank P. Emerson of the Shawmut Machinery Company, of Boston, testified that his company made and put out to shoe manufacturers a McKay sewing machine of improved design, as well as a vamp and lining cementing machine, a power hammer, a tip scouring machine, and a seam rubber (R. Vol. 1, p. 910).

All of these machines are in direct competition with machines of the United Company (R. Vol. 1, p. 858, lines 35–45; p. 859, lines 1–21; Defs.' Ex. 232, R. Vol. 5, pp. 482, 483, 484, 490, 527).

Fortuna Machine Company.

George H. Diehl, Jr., of New York City, president of the Fortuna Machine Company organized in 1903, testified that they "manufacture skiving machines for skiving the uppers, vamps, and all parts of shoes" (R. Vol. 1, p. 910, lines 44–46; p. 911, lines 1–3).

The United Company puts out two similar machines in direct competition with the Fortuna machine (Defs.' Ex. 232, R. Vol. 5, pp. 481, 509).

Brockton Heel Company.

Wendell P. Bosworth, connected with the Brockton Heel Company, testified that they "supply shoe manufacturers with a heel-log building machine" and also a sanding machine (R. Vol. 1, p. 911, lines 21–34).

The United Company puts out heel building machines but not heel-log building machines. It also puts out sanding machines (Defs.' Ex. 246, R. Vol. 5, pp. 684, 688).

Stewart Brothers.

J. Hammond Stewart of Lynn, "connected with Stewart Brothers, who have been manufacturing counter machinery for approximately twenty years," which machinery "is used

for making and adjusting molded counters to the last," named and described five different machines which they build (R. Vol. 1, p. 912, lines 8–14, 33–34).

The United Company puts out several counter skiving machines which compete with Stewart machines (Defs.' Ex. 232, R. Vol. 5, p. 508), but does not have a complete line of counter machinery.

Keighley Company.

Leopold C. Tappey testified that during the year 1911, the Keighley Company, of New Jersey, "made a cleaning machine, a finishing machine, a polishing machine, and an inseam trimmer" (R. Vol. 1, p. 912, lines 38–43; p. 913, line 1).

All these machines are in direct competition with machines of the United Company or of the Xpedite Company (Defs.' Ex. 232, R. Vol. 5, pp. 513, 524–526).

C. S. Pierce Company.

Eben W. Thomas, treasurer of C. S. Pierce Company, testified that they market a machine used for skiving upper leather (R. Vol. 1, p. 913, lines 26–32).

The United Company puts out two machines of this character (Defs.' Ex. 232, R. Vol. 5, p. 481).

Beckman Machine Company.

Aaron Beckman of Lynn, connected with the Beckman Machine Company, testified that he had put out a heel finishing machine and a heel beading machine (R. Vol. 1, p. 926, lines 1–12).

The United Company, through the Xpedite Company, puts out one machine for performing both of these operations and also puts out directly two other heel beading machines (Defs.' Ex. 232, R. Vol. 5, p. 524).

Beckwith Box Toe Company.

Harry H. Beckwith of Boston testified that the Beckwith Company, which had been in business ten years, had put out during the past two years about two hundred machines used to soften the box toes in the lasting operation and that the United Company "has a machine for performing a similar operation" (R. Vol. 1, p. 926, lines 25–33).

The machine of the United Company referred to is put out in two models (Defs.' Ex. 232, R. Vol. 5, p. 510).

Boston Machine Works Company.

Harry I. Illingworth, manager of the Boston Machine Works Company, testified: "We manufacture shoe machinery, special machinery, and tools," specifying seventeen types of machines which they put upon the market as follows:—

> "We make the Monarch and the Boston beading machines for beading the tops of shoes, the Julian cementing machine, used for cementing the soles of shoes, and the New York fold cementing machine, used for cementing the edges of skived leather before folding. We have put out during the last ten years seven or eight hundred Julian cementing machines. They have gone to shoe manufacturers. We make folding machines, the Booth folding machine, used for folding the edges of the upper; the Boston machine, for similar work of a heavier character; a foot-power machine for small pieces, such as backstays; and a vamp machine, which is a special machine for folding the vamp. We make the Rochester lacing machine for lacing the upper to give the proper opening before being lasted, and marking machines for marking leather; a lining pricking machine; a snipping machine, used for snipping the edges of curves of the upper leather before folding; a tip scouring machine, and a flap-slashing machine, used for slashing the curves in the shank of the insole. We have put out perhaps fifty flap-slashing machines. They were principally sold in this country. The Julian cementing machines were nearly all—about 90%—sold in this country. We formerly made a hook-hole punching machine, but do very little on it now. It was used to prepare the upper for setting of the hooks. We handle the Union Seam rubbing machine, but do not

make it. We have the exclusive sale of it. It is used for pressing the seams of the uppers. . . . We make an insole pinking machine" (R. Vol. 1, p. 926, lines 39–44; p. 927).

He added: "We hold ourselves ready to supply all of the machines named" in our catalogue. "We employ 100 men, more or less, altogether" (R. Vol. 1, p. 927, lines 39–42; catalogue in Defs.' Physical Ex. 321).

The United Company puts out machines for performing nearly all of the operations which are performed by the various machines mentioned by Mr. Illingworth (Defs.' Ex. 232, R. Vol. 5, pp. 481, 490, 493, 496, 499–501, 504–407, 527).

Larsen Machine Company.

Charles G. Wirths, an officer of the Larsen Machine Company, of New York, testified: "We make a welt and outsole lockstitch machine. It is used principally by shoe repairers." "There is no reason why it could not be used for making new shoes except that it is not as fast as a Goodyear stitcher" (R. Vol. 1, p. 928, lines 2–15).

The Goodyear Outsole Rapid Lockstitch Machine of the United Company is put out for this character of work (Defs.' Ex. 232, R. Vol. 5, p. 516).

Matson-Hoyt Machine Company.

Carl A. Matson of Lynn testified that the Matson-Hoyt Company "make a heel-finishing machine" sold "directly to shoe manufacturers" of which "about a dozen" had been put out "within the last three years" (R. Vol. 1, p. 928, lines 29–38).

The United Company, through the Xpedite Company, puts out a machine of this character (Defs.' Ex. 232, R. Vol. 5, p. 524).

Quarmby & Hilliker.

Charles T. Hilliker of Lynn testified that Quarmby & Hilliker make more than half a dozen types of machines, including sole cutting and leather stripping machines, which go to shoe

manufacturers and "to persons making parts for shoe manufacturers, such as soles or linings or uppers." "We have made between one hundred and fifty and two hundred dinking machines." Referring to his catalogue and letter contained in Defendants' Physical Exhibit 321 (p. 10 and the reverse of p. 11), he said "We . . . could make any of the machines named if we were asked to" (R. Vol. 1, p. 928, lines 42–45; p. 929).

The United Company puts out substantially the same line of machines (R. Vol. 1, p. 929, lines 27–29; Defs.' Ex. 232, R. Vol. 5, pp. 480, 481, 496–498, 501, 502, 506).

Holmes Leather Working Machinery Company.

Frank A. Bradford, manager of the Holmes Machinery Company of Cambridgeport, testified that they make a sole-leather roller sometimes sold to shoe manufacturers (R. Vol. 1, p. 941, lines 29–33).

The United Company also puts out such rolling machines (Defs.' Exs. 227, 228, R. Vol. 5, pp. 427, 437).

Harlow Shoe Finishing Machinery Company.

Edwin E. Bartlett of Hyde Park, connected with the Harlow Shoe Finishing Machinery Company, testified that he had put out about one hundred and thirty-seven heel finishing machines to shoe manufacturers and also put out personally a heel-seat beading machine (R. Vol. 1, p. 942, lines 6–14).

The United Company, through the Xpedite Company, puts out one machine for performing both the heel finishing and heel beading operations. It also puts out directly two other heel-seat beading machines (Defs.' Ex. 232, R. Vol. 5, p. 524).

W. J. Young Machinery Company.

William J. Young of Peabody, treasurer of the W. J. Young Company, testified that they manufacture or put out "a heel building machine;"

> "a buffing machine for buffing counters and box toes; a wedge-strip beveling machine, which makes wedge lifts

for use in heels, and which goes to shoe manufacturers and heel manufacturers, probably more to the latter; a heel compressing machine, which is sold almost altogether to heel manufacturers at the present time; a wedge lift-cutting machine for dieing out the wedge lifts from the wedge strips in connection with the heel, which goes to both heel makers and shoe manufacturers; a counter end finishing machine which is used in connection with the counter; a heel-lift gouging machine, which goes to both heel makers and shoe manufacturers about equally; a counter molding machine; a box-toe skiving machine; a counter-skiving machine; a shank-piece skiving machine; and a spring-heel scarfing machine. We do not build a rand-splitting machine, though we may possibly have handled one or two secondhand, and have not as yet put out a treeing machine. We do put out a waxing and rolling machine for counters. We employ between forty and fifty men.

"We have been in business for twenty-four or twenty-five years. Our business has been growing. . . . We lease on a royalty rental our automatic lift-die machine, which has not yet been mentioned, and our counter-buffing machine, and one or two machines for molding the heel seat. The others we sell. . . . we are preparing to build a pneumatic treeing machine. . . . We make a rand trimming machine" (R. Vol. 1, p. 942, lines 34–45; p. 943, lines 1–16, 27–30).

He stated also that, during seven or eight years, he had "put out between two and three thousand heel building machines" in this country, largely to shoe manufacturers, and also "three or four hundred counter-molding machines, over three hundred heel-compressing machines, and one hundred and fifty to two hundred lift-gouging machines." "We advertise ourselves as manufacturers of the most complete line of counter and heel making machines, and we consider that to be true" (R. Vol. 1, p. 942, lines 28–33; p. 943, lines 16–24).

Practically all of these machines named by Young are in direct competition with machines of the United Company (R. Vol. 2, p. 2445; Defs.' Exs. 228, 232, 235, R. Vol. 5, pp. 431, 432, 435, 497, 498, 504–509, 526, 653, 654).

Donnelly Machine Company.

John F. Donnelly of Brockton testified that the Donnelly Machine Company "designs, manufactures, and rebuilds shoe machinery." He named eight or ten different machines all of which, except two, "operate on the bottom or the heel of the shoe" (R. Vol. 1, p. 943, lines 36–44; p. 944).

With hardly a single exception, all of these machines are in direct competition with machines of the United Company (Defs.' Ex. 232, R. Vol. 5, pp. 481–483, 519, 522–525; as to McKay sewers, see also R. Vol. 1, p. 858, lines 35–45; p. 859, lines 1–21).

American Worsted Machinery Company.

Bicknell Hall of Abington testified that for seven years, beginning about 1907, he had been connected with the American Worsted Machinery Company which had, ready to put out, more than a dozen types of machines and had facilities for making and were ready to make about a dozen others; he quoted specific prices therefor. They had made and put out twenty-five or thirty McKay channeling machines to shoe manufacturers and had also made and sold "between one hundred and twenty-five and one hundred and fifty eyeletting machines." They had also handled a McKay sewing machine and made parts for it (R. Vol. 1, pp. 953–954; p. 976, lines 25–28).

With hardly a single exception all of the machines named by Mr. Hall are in direct competition with the machines of the United Company (Defs.' Exs. 232, 235, R. Vol. 5, pp. 482, 483, 490–491, 494–495, 500, 503–505, 507, 517, 519, 525, 603; see also Vol. 2, p. 2246 and P.'s Ex. 190 (a physical exhibit)).

Atlas Tack Company.

William F. Donovan, president of the Atlas Tack Company, testified:—

> "Our output during the last year has been from forty to sixty million eyelets per month. Three or four years

ago, before my advent into the business, it was nearly twice as high. Practically all of the eyelets we make go into the shoe trade" (R. Vol. 1, p. 959, lines 7–10).

The "United Company owns or has an interest in" several competing eyelet concerns (R. Vol. 1, p. 477, lines 1–4).

ADDITIONAL SHOE MACHINERY MANUFACTURERS CALLED IN REBUTTAL.

We have omitted, in the foregoing, reference to the testimony of certain of the rebuttal witnesses, as for example Morris of the Singer Sewing Machine Company, Spaulding of the Willcox and Gibbs Company, and Heath of the Boston Last Company (R. Vol. 1, pp. 886, 890–891, 901), whose concerns admittedly supply shoe machinery to shoe manufacturers but do not supply machines for the operations as to which the United States charges a monopoly. We have likewise omitted reference to still other witnesses, such as Chamberlain of the Walpole Shoe Supply Company and Hammond of the Becket & Hammond Machine Company (R. Vol. 1, pp. 889, 925), whose concerns actually supply machines for such operations to shoe manufacturers *although the United Company does not supply machines competing therewith* (Defs'. Exs. 232, 235, R. Vol. 5, pp. 521, 622).

Supreme Court of the United States

OCTOBER TERM, 1917

In the Supreme Court of the United States

OCTOBER TERM, 1917.

No. 207.

THE UNITED STATES, *Appellant*,

v.

UNITED SHOE MACHINERY COMPANY, OF NEW JERSEY, ET AL., *Appellees*.

REPLY TO BRIEF FOR THE UNITED STATES.

GENERAL CONSIDERATIONS APPLICABLE TO BRIEF FOR THE UNITED STATES.

The brief for the United States contains no specification of errors relied upon as required by the Supreme Court rules and pays little regard to the charge made by the petition or the issues which the United States presented in the court below, or the admissions made by the attorneys for the United States in the course of the trial in that court.

No reference is made in the brief to the fundamental question which lies at the threshold of the case, viz., whether there is any evidence to support the findings of the District Court upon disputed questions of fact, all of which were adverse to the United States. The brief in most instances does not even attempt to state the evidence which sustains the District Court's findings, but only the evidence on which

the United States relied in the District Court and which that court either did not accept as true or did not feel sustained the contentions of the United States in view of other evidence in the case. Many facts are stated in the brief as if they were undisputed or uncontradicted, when in truth they were absolutely disproved or found unsustained by the District Court, or abandoned by the attorneys for the United States who conducted the trial.

Furthermore, the brief for the United States in many instances seriously misstates and misconstrues the evidence to which it does refer. The result is that the argument of the United States is founded largely upon conclusions and assumptions which have no foundation in the record.

For example, the brief writer says of the testimony of one witness (p. 46), "he made no comparison between the Eppler and Goodyear *welter* further than to say that they ran side by side in the same factory" (italics theirs). As a matter of fact the witness said, "The Goodyear welter was the best" (R. Vol. 1, p. 938, line 2).

The brief asserts that Mr. Winslow testified that the McKay sewing machine could be obtained elsewhere, but that he was wholly unable to name any concerns other than the United Company which manufactured it (p. 133). The fact is that Mr. Winslow named 26 different concerns, some of which he stated were manufacturing it, and some of which were dealing in it (R. Vol. 1, pp. 858–859).

The brief asserts (p. 67) that "*the United Company acquired the shoe machinery business* and assets of fifty-six individuals, partnerships, and corporation . . ." (italics ours). As a matter of fact the majority of these concerns were not engaged in the shoe machinery business at all (see Main Brief, pp. 456–463).

The brief asserts (p. 42) that Whitman testified that the work done by the Eppler machine was satisfactory. Whitman made no such statement. He testified that the Goodyear "did better work on the shoe" (R. Vol. 1, p. 916, lines 15–16).

The brief asserts (p. 91) that the United Company acquired from Joseph W. Leary "his business of *manufacturing* and dealing in shoe machinery" (italics ours). The record shows that Leary was doing no manufacturing of any kind (*infra*, p. 167).

The brief not only cites figures taken from the Census of Manufactures, 1914 (foot-note, p. 8), which were not in evidence at all, and which differ from the situation which the evidence showed existed in 1911 (R. Vol. 1, p. 26, line 39), but it also incorrectly states the figures given by the Census of 1914, as a reference to the original document will show (*infra*, pp. 75–77).

The foregoing are only illustrations of numerous distortions of the testimony.

In respect to the leases the brief makes statements as to the various clauses and their effect which are wholly without justification.

We are able in this reply brief to deal with only a few of these misconstructions, omissions, and misstatements, but we believe we refer to enough to show that the brief gives an entirely erroneous view of the case.

We believe ourselves justified in saying that the brief writer, disregarding every canon of fair play, has sought by exaggerated and distorted statements and by vituperation to divert the Court's attention from the real issues in the case.

THE CASE WHICH THE UNITED STATES UNDERTOOK TO PROVE AND THE CASE AS NOW PRESENTED.

Before considering specifically the brief writer's contentions and arguments we wish to call the Court's attention to the difference between the case which the United States charged in the petition and undertook to prove and the case as now presented to this Court.

The case which the United States undertook to prove was as follows:—

The United States charged that the constituent companies in 1899 held patents under which they lawfully controlled practically all the business of the country in certain specified kinds of bottoming machines; that these patents were about to expire and thus the lawful monopoly those companies held would be lost. It charged that the defendants thereupon determined to continue the monopoly of the constituent companies by unlawful means after the expiration of the patents and to extend this unlawful monopoly to all other kinds of shoe machinery. It alleged that they carried out this purpose by combining the constituent companies, by undertaking to acquire all concerns engaged in manufacturing any and every kind of shoe machinery, that is, the kinds which were not manufactured by the constituent companies, by buying up all competitors who entered the business at exorbitant prices, by threats against and intimidation of competitors, by exacting unlawful covenants from all who were engaged in the business and all inventors whose business or inventions they acquired, by buying patents and not

using them, and finally, by discontinuing the sale of machines, by refusing to lease any essential machines unless the shoe manufacturer took from them practically all other machines of the kinds he needed, and by inserting in the leases covenants on the part of the lessee requiring him to use the United Company's machines of the kind leased, and of all other kinds exclusively for seventeen years, and that by these means the United Company acquired a complete monopoly of all shoe machinery.

This is the case the United States undertook to prove. It was a wholly fictitious case without any foundation or justification in fact. As the evidence was presented in the District Court the United States was gradually compelled to admit it could not prove, and therefore to abandon most of its various charges, and the remainder were completely disproved.

Thus it developed in the trial that the patents of the constituent companies were not about to expire in 1899 and that this was, therefore, not a motive for the formation of the United Company; that the defendants never attempted to acquire all concerns engaged in the shoe machinery industry; that they never attempted to acquire all competitors, although a large number of such competitors exist and although the principal competitors were offered to the United Company for sale; that, as a matter of fact, they did not acquire competing concerns at all, but that the acquisitions were made to enable them to obtain something new such as supplies which they were not then manufacturing, other types of machines which they did not have or inventions to assist them in developing new machines or to improve their existing machines; that these acquisitions were not made at exorbitant prices; that the United

Company did not acquire patents and hold them without making any use of them as alleged; that the covenants taken from inventors and vendors were only such as are lawful, usual, and normal in such transactions; that, in spite of every possible effort to prove the contrary, the United Company did not intimidate or threaten competitors or lessees, but that its conduct was in these respects above reproach; that the United Company did not discontinue the sale of machines, as the constituent companies had never sold them; that it did not refuse to lease machines unless the shoe manufacturer took practically all other machines from them; and that it did not insert in its leases covenants requiring the lessee to use its machines of the kind leased or of any other kinds exclusively, and that it did not acquire a monopoly of all shoe machinery.

In other words, the entire case which the United States undertook to prove was shown to be without any foundation and all of the charges on which it was based were either abandoned by counsel or found by the District Court to be unfounded.

The United States, therefore, attempted to make a new case, and it is this attempt to prove a new and different case which is before this Court. It now charges that there was competition between certain of the constituent companies. It was disproved that there was such competition in any practical or material sense, but even if the contentions of the United States were true, it is clear that the competition was so trivial that no reasonable person could believe that the United Company was formed to eliminate it or that its elimination was of any practical consequence in the trade. The United States, while abandoning the charge of an attempt to acquire all concerns engaged in the shoe machin-

ery industry, still charges that competitors were acquired, but the evidence in this respect, as the District Court found, is totally unconvincing. Its attempts to prove that the United Company used threats or intimidation or that it exacted unlawful covenants from vendors or inventors are equally unconvincing. The United States has abandoned all attempt to prove that the United Company's leases contain any covenants requiring the lessee to use all kinds of machinery exclusively, or that the United Company refuses to lease machinery of one type unless all other kinds are taken. It now merely insists that the leases do have the effect of requiring the lessee to take and use a certain number of bottoming machines forming only a very small portion of the total number and types of machines furnished by the United Company, and a still smaller proportion of the total number and types of machines which the shoe manufacturer requires. The United States disclaims any contention that the United Company has a monopoly of all shoe machinery, and has limited its charge to a monopoly of a comparatively few types of patented bottoming machines in which the United Company has specialized, and which either it or its constituent companies created under its patents.

In its attempt to prove this very different case the United States has in its brief completely disregarded the findings of the District Court, omitted reference to all testimony unfavorable to it, and distorted much of the testimony to which it does refer.

COMMENTS UPON THE PORTION OF THE BRIEF FOR THE UNITED STATES TREATING OF THE LEASES.

The brief for the United States asserts that, irrespective of whether the original formation of the United Company, or the subsequent acquisitions of that company, were lawful or unlawful, the defendants have adopted and are enforcing a system of leasing which is unlawful in itself (see Brief for the United States, p. 154).

This is not the charge made by the petition. The petition charges that the clauses in the leases objected to were adopted in pursuance of the unlawful plan specified in the petition and that they constituted only a step in carrying out such unlawful plan. That the leases were not adopted for the purpose of carrying out this plan and are clearly not adapted to carry out any such a plan is conclusively shown by the record (see our Main Brief, pp. 347–357).

Furthermore, the United States does not limit its criticism to clauses which the petition specifically charges are contained in the leases and are unlawful. The allegations of the petition in respect to the leases are (see our Main Brief, pp. 235–238) that the United Company discontinued selling machines and adopted arbitrary and oppressive leases which are stated to be unlawful in that they—

(1) Required the lessee to covenant to use the United Company's machines, both of the kind leased and of all other kinds exclusively;

(2) Permitted the United Company to cancel its leases of all machines if these covenants were broken; and

(3) Required the lessee to use the leased machinery for seventeen years.

The United States in its brief criticises the seventeen-year term contained in the leases. But there are no covenants in the leases requiring the lessee to use the United Company's machines of the kind leased exclusively or requiring the lessee to use other kinds of machines at all, and, of course, no clause permitting the United Company to cancel its leases if these covenants which are not contained in the leases are broken. While the United States attempts in its brief to show that such covenants appear in the leases indirectly, its contention wholly fails. Its argument, therefore, is mainly directed to a criticism of clauses which are not such as are specified in the petition as unlawful.

Furthermore, the argument of the United States is based upon a misconstruction of the clauses of the leases, upon unwarranted inferences and upon misleading illustrations. Its findings as to the effect of the leases, therefore, are entirely unwarranted.

There also runs through the entire argument the contention that the United Company cannot charge a lower rate for the use of a series of machines than is charged for the use of the various machines of the series when taken for use separately, a view so opposed to the interests of shoe manufacturers, who, if this were true, would be deprived of the right to share in the economies resulting from a wholesale use of a series of machines, and so opposed to the usual and normal business practice of charging a wholesale rate for the use or purchase of a number of articles, that we submit it has no justification.

We respectfully call the Court's careful attention to the following analysis of the contentions of the United States.

Contention of the United States in respect to the Exclusive Use Cancellation Clause.

The brief writer charges that the Exclusive Use Cancellation Clause compels a shoe manufacturer taking a lease of a machine to use machines of this same kind obtained from the United Company exclusively. This is not the fact.

The brief writer says (p. 173),—

> "The exclusive-use clause, for example, obviously limits the freedom of choice of every lessee as to all his future needs for machines of the kind leased and clearly restricts access to him, as a possible customer for any such machines, of all who seek to compete with defendants as to those machines."

See also Brief for the United States, pp. 175–176.

The Exclusive Use Cancellation Clause does not forbid the lessee to use other machines of the same kind. On the contrary, it expressly recognizes the lessee's right to take a competitor's machines of the same kind. It merely provides that if the lessee supplies himself with other machines of the same kind the United Company may withdraw its own machines of this kind (see our Main Brief, pp. 312–323).

If, therefore, a shoe manufacturer holding, for example, one of the United Company's lasting machines under lease desires to discard such machine and obtain a machine from a competitor to do his lasting, the Exclusive Use Cancellation Clause obviously does not prevent his doing so. This clause merely permits the United Company in such a case to withdraw its own machine. Since the shoe manufacturer in the case stated has given up the use of the United Company's lasting machine, such withdrawal is certainly fair and it cannot injure the shoe manufacturer.

The Full Capacity Clause, which requires the shoe manufacturer to use a machine which he leases to the extent that he has work for it on shoes on which he is authorized to use it, is the only clause in any lease which would interfere with such shoe manufacturer ceasing to use the United Company's machine and substituting for his work a competitor's machine.

If such shoe manufacturer holding a lasting machine under lease from the United Company does not wish to discard the machine but decides to double his output and to take an additional machine from a competitor, the Exclusive Use Cancellation Clause again does not prevent. Under the Exclusive Use Cancellation Clause the United Company's sole right is to withdraw its own lasting machine if it so desires. We have shown that this right is reserved in order to protect the United Company against an unfair or dishonest use of its machine and that it has never been enforced for any other purpose (see our Main Brief, pp. 318–319). But assuming that the United Company in the case just stated would enforce the clause by withdrawing its own machine, what would be the result? The fact that such shoe manufacturer takes his additional lasting machine from a competitor shows that he prefers such competitor's machines. Therefore, when the United Company withdraws its lasting machine the shoe manufacturer is free to use the competitor's machine which he prefers in place of the United Company's machine which he had leased and by the Full Capacity Clause had agreed to use.

The statement of the brief writer, therefore, that the Exclusive Use Clause cuts off the right of the shoe manufacturer to take a competitor's machines of the same kind either for present or future work is without foundation.

Such being the fact, the United States in its brief filed at the last hearing attempted to show that the Exclusive Use Cancellation Clause taken in connection with the Cancellation for Breach Clause has a more far-reaching effect than that stated above. Its contention was that the Exclusive Use Cancellation Clause was a "condition . . . expressed to be obligatory upon the lessee"; that a lessee who supplied himself with other machines of the same kind as those leased violated this condition which he had agreed to fulfil; and that, therefore, the United Company could cancel all its leases of the machines of all kinds held by the lessee under the Cancellation for Breach Clause. In other words, it contended that by the exercise of the Exclusive Use Cancellation Clause a lessee who took a lasting machine from a competitor might lose his welting, pulling-over, and other machines.

That this is absolutely untrue is proved by an examination of any of the leases. Take, for example, P.'s Ex. 21, R. Vol. 3, p. 182, referred to by the United States as a sample lease. This lease provides (p. 182),—

> "And the following are agreed to as conditions of this agreement, all of which the lessee covenants and agrees to keep and perform."

There follow seven numbered paragraphs providing for various matters, such as the payment of royalty, taxes, the use of the machine, etc. The lease then provides (p. 187),—

> "And that the following stipulations and provisions are agreed to."

There then follow certain provisions, including the Exclusive Use Cancellation Clause and the Cancellation for

Breach Clause. The Exclusive Use Cancellation Clause (par. eight, pp. 187–188) provides that if the lessee fails to use lasting machinery of the lessor for lasting all his shoes, the lessor may terminate his leases of lasting machinery. The Cancellation for Breach Clause (par. nine, p. 188) provides that if the lessee commits a "breach or default" in the observance of any "conditions" contained therein or in any other lease "expressed to be obligatory upon the lessee," the lessor may cancel all leases. It is obvious: (1) That the "conditions" referred to in the Cancellation for Breach Clause which authorize cancellation are only those expressly defined as such in the lease and contained in paragraphs one to seven inclusive. The Exclusive Use Cancellation Clause is not one of these conditions. (2) That the Exclusive Use Cancellation Clause is not obligatory upon the lessee, but a mere option reserved by the lessor, and, therefore, clearly not a condition "expressed to be obligatory upon the lessee" such as is referred to in the Cancellation for Breach Clause. No "breach or default" can be committed of this clause. It results that a shoe manufacturer by supplying himself with another machine of the same kind as one already leased does not violate any condition obligatory upon him, and does not give the United Company any right to cancel its leases of all machines under the Cancellation for Breach Clause. This is the plain meaning of the language used and the interpretation which has always been placed upon the clauses.

This being the case, the United States in its present brief does not flatly state that the use of other machines gives the United Company a right to cancel all leases, but the brief writer implies that such is the case (Brief for the United States, pp. 175–176). The writer states that the

fear that this right may exist deters a shoe manufacturer from obtaining other machines of the kind leased. There is not the slightest evidence that any shoe manufacturer ever supposed that the Exclusive Use Cancellation Clause gave this right, or that the United Company ever asserted that it did. In a footnote (p. 176) our statement that the Exclusive Use Cancellation Clause is not a condition obligatory upon the lessee is called a "quibble." It is not a quibble; it is a simple statement of fact which completely refutes the contention of the United States as to the effect of the Exclusive Use Cancellation Clause on which a considerable portion of its argument in respect to the leases is founded.

Contention as to the Cumulative Effect of the Full Capacity Clause and the Cancellation for Breach Clause.

At page 173 of the brief for the United States the writer admits that certain clauses considered by themselves, such as the Full Capacity Clause, may be "unexceptionable," but he contends that the "combined and cumulative effect" of such clause with other clauses constitutes a clearly illegal restraint of trade.

He states that if it be assumed that the Full Capacity Clause standing alone is lawful, nevertheless, taken in connection with the Cancellation for Breach Clause it has a far wider and unlawful effect.

The Full Capacity Clause requires the shoe manufacturer to use the leased machine to full capacity on shoes of the kind on which he is permitted to use it so far as he has such work for it to perform. The result, of course, is that the

shoe manufacturer, having taken this machine and agreed to use it, cannot, provided he has such work for it to perform, discard the machine and use another machine without violating his agreement (p. 174). For any additional work he may have or for any work which he is not authorized to do on the leased machine he is free to use other machines. If he violates the Full Capacity Clause by discarding the United Company's machine and substituting another machine, all his leases may be cancelled if the United Company exercises its option under the Cancellation for Breach Clause.

The United States contends that in this way the Cancellation for Breach Clause gives the Full Capacity Clause an additional or cumulative effect. But this is entirely untrue, except that the Cancellation for Breach Clause gives a remedy in case of a violation of the Full Capacity Clause just as it gives a remedy in case of a violation of the agreement to pay taxes or royalties. So long as the lessee fulfils his lawful agreement contained in the Full Capacity Clause, the Cancellation for Breach Clause has no effect whatsoever, as it cannot be exercised.

Would the brief writer contend that the right to cancel the leases for a default by the lessee to comply with his agreements to pay taxes as agreed makes the agreement to pay taxes unlawful? If not, the right to cancel for failure to abide by the Full Capacity Clause cannot make that clause unlawful.

The contention of the United States is that, though the United Company may lawfully require a lessee to agree to use his leased machine to capacity so far as he has work for it to perform, it cannot provide a remedy in case the lessee decides he does not wish to abide by his agreement. In

other words, it contends that, though the lessee may be lawfully asked to covenant to use the leased machine, the United Company is not entitled to protection if he fails to do so. The mere statement of this proposition is sufficient refutation.

The fact that shoe manufacturers taking machines which they have agreed to use are not free to discard these machines and substitute a competitor's machine is not due to the cumulative effect of these two clauses, but is due solely to the effect of the Full Capacity Clause.

Alleged Cumulative Effect of the Full Capacity Clause and the Restricted Use Clause.

The Restricted Use Clause is a mere restriction on the use of the United Company's leased machine. It does not require the lessee to use the leased machine or any other machine. It merely provides that the United Company's machine shall not be used under certain conditions (see our Main Brief, pp. 331–332).

The contention of the United States in respect to the leases is that a lessee taking one machine is unlawfully required or compelled to use other machines.

At the previous hearing in this Court and in the District Court the contention of the United States was that the initial payments charged for unrestricted leases were so excessive that a shoe manufacturer desiring to take one kind of machine from the United Company was compelled to take a restricted lease of the machine, and that owing to the restrictions in such lease he was compelled to take certain other machines which he would otherwise have taken from competitors in order to use the machines which

he did desire to take from the United Company. While the machines which, according to this contention, he was thus indirectly induced to take were limited in number, the United States practically rested its contention on this argument.

In the present brief the writer advances for the first time a new contention, namely, that by the combined effect of the Full Capacity Clause and the Restricted Use Clause, the lessee is made to agree to take other machines than those leased, and further, that the combined effect of these two clauses may compel him to do business with the United Company forever.

The contention is ingenious but entirely fallacious, being based upon a complete misconstruction of the Full Capacity Clause. The actual fact is that the combined effect of the Full Capacity Clause and the Restricted Use Clause is to limit the scope of the Full Capacity Clause, not to enlarge its scope.

The argument of the brief writer is as follows (Brief for the United States, pp. 180–181):—

A lessee takes a lease of lasting machines in 1910. In 1926 he takes a restricted lease of metallic machines. In 1927 his lease of lasting machines expires. His lease of metallic machines, however, runs for sixteen years longer. He has agreed by the Full Capacity Clause in the metallic lease to use the metallic machines to capacity, and on account of the Restricted Use Clause contained in that form of lease he can only use the metallic machines in connection with the United Company's lasting machines. To fulfil his agreement to use the metallic machines the brief writer alleges he must, therefore, take another lease of lasting machines. It is alleged he is thus required by the Full

Capacity Clause and the Restricted Use Clause in the metallic lease to use other types of machines, that is, lasting machines, and to take a new lease of such lasting machines when his existing lease expires. Thus, it is alleged, as his leases expire he must renew them.

This illustration, according to the brief writer, shows (p. 181),—

> . . . "the hollowness of the defendants' contention that the prohibitive clause is a mere restriction of the right to use the machine leased under it and not an obligation of the lessee that he will not use other machines."

So it would if his statement of the case were true.

But this ingenious contention is based entirely on a misstatement as to the wording and scope of the Full Capacity Clause.

Take the Full Capacity Clause contained in P.'s Ex. 30 (R. Vol. 3, p. 278), which is the restricted form of metallic lease. This provides as follows (par. three, p. 281):—

> "The lessee shall use the said machinery to its full capacity so far as the number and kind of boots and shoes made in his factory will permit, except that the lessee agrees that the said machinery shall not be used in the manufacture of any boots or shoes which are lasted on machines other than those leased from the lessor. . . ."

The clause clearly provides that the lessee shall use the metallic machines to capacity only if and to the extent that he has shoes which are lasted on the United Company's machines. The lessee is not required by the metallic lease to have any shoes so lasted, and if he has no such shoes he not only is not required to use the United Company's metallic machines to capacity on other kinds of shoes, but he is forbidden to do so.

The actual result in the instance cited by the brief writer is, therefore, the exact reverse of what he alleges. When the shoe manufacturer's lease of lasting machines expires in 1927 he remains under an obligation to use the United Company's metallic machine only if he has shoes lasted on the United Company's lasting machines. He is absolutely free to return the United Company's lasting machines and to obtain his lasting machines from a competitor. If he does so, he will have no shoes lasted by the United Company's machines and, therefore, will be freed from any obligation to use the United Company's metallic machines either to capacity or at all. In fact he will be forbidden to use them on the shoes he is then making unless he changes his restricted lease of the metallic machines for an unrestricted lease.

Instead, therefore, of compelling the shoe manufacturer to take a new lease of lasting machines, the Restricted Use Clause in the metallic lease enables the lessee by using a competitor's lasting machines to free himself from his obligation under the Full Capacity Clause to use the metallic machines if he so desires, although his lease of those machines runs for an additional sixteen years.

The conclusion of the brief writer (p. 180),—

> "It results that a manufacturer once within the toils of the tying clauses never can escape,"—

is entirely false, as is also his conclusion (p. 181) that

> "in agreeing to a lease containing both the full capacity and the prohibitive clause the shoe manufacturer does agree that he will not use machines"

of other kinds supplied by competitors.

It may be noted in passing that in order to make the foregoing argument it has been necessary for the brief writer to omit in quoting an example of the Full Capacity Clause a controlling limitation contained in the very sentence which he purports to quote (see Brief for the United States, p. 165). The clause as there quoted begins,—

> "The lessor shall use the leased machinery to its full capacity. . . . "

The sentence as contained in the lease begins,—

> "Subject to the foregoing limitations, the lessee shall use the leased machinery to its full capacity . . ."

The words "subject to the foregoing limitations" are omitted in the quotation of the Full Capacity Clause at page 165 of the brief. The limitations referred to provide that the machine shall not be used on shoes on which certain operations are not performed by the United Company's machines.

Specific Example Cited by the United States to Illustrate the Effect of the Leases.

Beginning with the last paragraph on page 176 of the brief for the United States a "specific case" is taken to show the effect of the various clauses in the leases and the extent to which they restrain competition.

It is of the utmost importance to analyze this example carefully, because it is an example carefully chosen by the United States itself to illustrate the effect of the leases which, according to the United States, makes

> "competition with them [*i.e.*, the United Company] either as to the existing or the future needs for machinery of existing or future shoe manufacturers . . . entirely impossible" (p. 181).

In introducing this specific instance the brief writer says (Brief for the United States, pp. 176–177):—

> "What is important here is the fact that a shoe manufacturer about to enter the field who finds, as he will find, that he is compelled by business necessity to take one important machine from the defendants under a lease which contains a 'prohibitive clause' [that is, a Restricted Use Clause] is thereby removed as a possible customer for competitors of the defendants not only as to machines of the particular type leased, but also as to all machines of other important types used in the bottoming of shoes. This can, perhaps, best be made clear by stating a specific case, based on the facts as they were at the filing of the petition."

A summary of the "specific case" cited by the brief writer and the argument of the brief writer in reference thereto is as follows:—

1. A shoe manufacturer desiring an equipment of machines finds he must obtain lasting machines from the United Company, because the R. H. Long Company is the only other concern "professing to put them out" and it furnishes no machines for lasting standard screw, loose-nailed, McKay sewed, or turn shoes (p. 177).

2. The above reason for taking lasting machines is reinforced by the fact that if the shoe manufacturer used other lasting machines his payments for pulling-over machines, if he took them from the United Company, would be nearly tripled, and his payments for clicking machines

if he also took them from the United Company, would be increased one-half a cent per pair of shoes (p. 178).

3. He, therefore, goes to the United Company for his lasting machines and decides to use the No. 5 lasting machine. Any lease he can obtain of this machine contains the Exclusive Use Cancellation Clause. By reason of this clause, according to the allegation of the brief writer, the shoe manufacturer is "committed" to the United Company "for all of his present and future demands for any kind of lasting machine" (p. 178). In other words, according to this contention, no competitor can thereafter furnish him with a lasting machine.

4. He also decides to take a restricted lease of the No. 5 lasting machine, because he finds that the unrestricted lease is "commercially impossible" (p. 179).

5. The Restricted Use Clause in the lease of the No. 5 lasting machine restricts it to use with the United Company's welter and stitcher, pulling-over and metallic machines. On account of this clause the lessee, already obliged by the Exclusive Use Cancellation Clause to use the United Company's lasting machines exclusively, is also prevented, according to the brief writer, from obtaining from competitors any welters and stitchers, pulling-over or metallic machines to satisfy any "future needs" (p. 179).

6. Since, according to the brief writer's contention, the Full Capacity Clause and the Restricted Use Clause taken together require the lessee upon the expiration of a lease of machines to use with which other machines are restricted to renew such lease, it follows, according to this contention, that as the leases of the welter and stitcher, pulling-over and metallic machines expire, the shoe manufacturer is obliged to renew them if he at the time holds a lease of

lasting machines, and thus he may be obliged to continue to deal with the United Company forever (p. 181).

7. The conclusion of the brief writer is that by these leases, the effect of which is as above shown, "the defendants have brought about a situation in which competition with them either as to the existing or the future needs for machinery of existing or future shoe manufacturers has become entirely impossible" (p. 181), with the result that

> ". . . The United Company is not merely 'a formidable competitor.' It is absolute monarch of the industry. No competitor can exist unless for its own pleasure or policy it withholds its destroying hand."

With two unimportant exceptions not a single statement or inference in the foregoing argument is correct. The conclusion arrived at, therefore, is without any foundation whatsoever.

We shall now consider these statements on which the brief writer's conclusion is based in detail. We call the Court's attention especially to this analysis of the contention of the United States in respect to the practical working of the leases, because if we are correct in our statement that these contentions of the United States are wholly unwarranted, the entire case of the United States in respect to the leases is shown to be without foundation.

1. It is first asserted by the brief writer that the shoe manufacturer whom he takes as an example, wishing to obtain an equipment of shoe machines, must go to the United Company for lasting machines, because the R. H. Long Company is the only other concern professing to put them out and it does not appear that this company is able to supply any lasting machines for standard screw shoes,

loose-nailed shoes, McKay sewed shoes, or turn shoes (p. 177).

Even if this were true it would not deter the shoe manufacturer desiring to make welt shoes from obtaining his lasting machines from the Long Company. But according to the testimony of witnesses for the United States, it is not true that the shoe manufacturer would be obliged to go to the United Company for his lasting machines. Thus a representative of the Haverhill Shoe Machinery Company testified that his company furnished

> "a full line of all kinds of shoe machinery, whether it is for welts or McKays or turns or pegs or anything else. We undertake to fill the requirements of a manufacturer whatever they are. . . . We are prepared to make good if our people that manufacture machines don't go back on us" (R. Vol. 1, p. 301, lines 3–9).

The manager of the Long Company testified that his company was ready to supply "a full line of machinery for welt and turn shoes" (R. Vol. 1, p. 345, lines 41–44). In spite of this testimony, the brief writer asserts that the Long Company makes no lasting machines for turn shoes (Brief for the United States, p. 177). Hamel testified that his company had a "complete set of machines for making turn shoes and a complete set of machines for making welt shoes" (R. Vol. 1, p. 327, lines 15–16). In addition there are foreign manufacturers of lasting machines whose machines could be imported (see our Main Brief, p. 612; also Defs.' Ex. 337, R. Vol. 5, p. 906, at p. 917). And any machine shop, if so requested, could manufacture lasting machines of the types in use a comparatively few years ago on which the patents have expired.

It thus appears that the unfortunate shoe manufacturer in question can obtain lasting machines from other sources if he so desires. If he insists upon going to the United Company and thus getting within its "toils," it is obviously because the United Company furnishes the best machines.

2. The brief writer next alleges that another reason why the shoe manufacturer would take the United Company's lasting machines is that, if he does not do so, his payments for pulling-over machines, if he takes them from the United Company, would be nearly tripled and his payments for clicking machines taken from the United Company would be increased one-half cent per pair (p. 178).

This statement as to the payments required for pulling-over machines is entirely incorrect. It is considered below (*infra*, p. 48-49). It is true that where the United Company's clicking machine is used with its lasting machine a lower royalty is charged for the use of these machines as a series. This, however, is fully justified as a wholesale rate (see Main Brief, pp. 424–426). This whole matter, however, is not of material consequence, because the shoe manufacturer can, if he obtains his lasting machines from a competitor, also obtain his pulling-over or clicking machines from a competitor, if they are on the market, or, like many other manufacturers, not use them at all. And if, as the brief writer asserts, he desires all three machines, and must obtain his lasting, his pulling-over, and his clicking machines from the United Company because no one else manufactures them, then, even on the brief writer's assertion, he is not affected by the fact that a higher or retail price is charged if he only takes one of the machines.

3. The shoe manufacturer, having determined to take the United Company's lasting machine, now determines

to take the No. 5 machine. Both forms of lease of this machine contain the Exclusive Use Cancellation Clause. According to the contention of the brief writer, the shoe manufacturer is obliged by this clause, both for the present and for the future, to use the United Company's lasting machines of all kinds exclusively (Brief, p. 178). We have shown above that this statement is entirely untrue (*supra*, p. 10). The Exclusive Use Cancellation Clause has no such effect. So far as this clause is concerned, the shoe manufacturer can obtain lasting machines from a competitor for both his present and future needs. The only right of the United Company in such case is to withdraw its own machine. If the shoe manufacturer should find that he prefers to use some other lasting machine, the fact that the United Company may in such case remove its own lasting machine will surely not deter him.

The only result so far reached is that the shoe manufacturer has a lease of a lasting machine or machines from the United Company and that by the Full Capacity Clause contained in the lease he has agreed to use these particular machines. He is, however, under no obligation to use the United Company's lasting machines exclusively, but can obtain any additional machines he may require from others. If the Full Capacity Clause, requiring him to use the particular machine or machines leased is lawful, it is obvious that no unlawful restraint so far exists.

4. The shoe manufacturer in taking a lease of the No. 5 machine is permitted to choose between a restricted form and an unrestricted form. According to the brief writer, he chooses the restricted form.

This is the beginning of his troubles. It is the Restricted Use Clauses in this form of lease which bring him "within

the toils of the Tying Clauses" from which he "never can escape" (p. 180).

He chooses this restricted form of lease, according to the brief writer, because of "certain conditions attached" to the unrestricted lease "which make the choice" of the unrestricted lease "commercially impossible" (p. 179).

What, then, are these conditions which make it impossible for him to choose the unrestricted lease and thus avoid the tyranny of the United Company? The conditions are that he is required to pay under an unrestricted lease $300 for each lasting machine he takes. His royalty will be the same as under the restricted lease. Let us assume he makes 250 pairs of shoes a day. Considerably over one-third of the shoe manufacturers dealing with the United Company make less than this number (R. Vol. 1, pp. 454–455). The No. 5 laster has a smaller daily capacity than any other machine put out, nevertheless two No. 5 lasting machines are sufficient to last 250 pairs per day (Defs.' Ex. 230, R. Vol. 5, p. 442). In other words, to obtain unrestricted leases which will enable him to obtain all his other machines from competitors and to use them with the United Company's lasting machines and thus escape from the toils of the Restricted Use Clauses will cost the shoe manufacturer $600. On the other hand, since, according to the United States, the United Company charges excessive prices for its machines, it would appear, if this contention is true, that the shoe manufacturer, by being enabled to take all his other machines from competitors, will make a considerable saving either in the cost of such other machines or in royalties. Under the circumstances it is ridiculous to say that it is "impossible" for him to take the unrestricted lease. He takes the restricted lease because

he prefers to take a series of the United Company's machines. To talk of his being coerced is absurd.

5. However, according to the brief writer, the shoe manufacturer does take the restricted lease which restricts his two lasting machines to use with the United Company's welter, stitcher, metallic and pulling-over machines. If he makes a McKay shoe, which is the class of shoe most largely made in the country, and, therefore, does not use a welter and stitcher, and if he does not use pulling-over machines, as many manufacturers do not, the only restriction which will concern him is the restriction to metallic machines. We will assume, however, that he is to make welt shoes and prefers to use a pulling-over machine. In such case, having chosen a restricted lease of lasting machines, he will take leases of the welter and stitcher, and pulling-over and metallic machines from the United Company to use with his lasting machines. He can take initial payment or non-initial payment leases. If he takes non-initial payment leases of these machines, and also of the United Company's heeling machine, the machines so taken will not be restricted to use with any except those he takes. The brief writer contends that when he takes leases of those machines he must use these kinds of machines so obtained from the United Company exclusively. The reason given is that because of the Exclusive Use Cancellation Clause he cannot have in his factory a lasting machine not obtained from the United Company and, therefore, must use these other types of machines obtained from the United Company exclusively, since his lasting machines can be used only with machines so obtained.

The conclusion arrived at is absolutely unsound. In the first place, the Exclusive Use Cancellation Clause has no

such effect. The shoe manufacturer can at any time he pleases obtain a competitor's lasting machine, as we have shown above (*supra*, p. 10). In the second place, the shoe manufacturer can at any time exchange his restricted lease of lasting machines for an unrestricted lease. The United States contends that he has no "right" to make this exchange, but the United Company has always been willing to permit lessees to do so and there is no ground whatsoever for contending that it will not continue to do so in the future.

The Full Capacity Clause is the only clause which requires the lessee to use these leased machines and that clause only requires him to use the particular machines leased, provided he has shoes on which he is permitted to use the machines. Unless this Full Capacity Clause prevents, the shoe manufacturer is free at any time to stop using all these machines so leased and to substitute other machines. Even though the Full Capacity Clause does require him to use these particular machines, if he increases his output beyond the capacity of these machines at any time, he may take additional machines from competitors to perform the work on such additional output. The only right the United Company would have in such a case would be to withdraw its own machines of the same kind as those used.

It, therefore, appears clearly that the brief writer's contention that the shoe manufacturer is, by reason of the Restricted Use Clause and the Exclusive Use Cancellation Clause, cut off from obtaining any welters and stitchers, pulling-over, metallic and lasting machines from competitors to satisfy all future needs is untrue.

6. The lease of lasting machines, as we have stated,

contains a Restricted Use Clause and a Full Capacity Clause. According to the brief writer, these clauses taken together have a cumulative effect, and compel the use not only of the lasting machines leased, but of other machines to use with which they are restricted (p. 180). Therefore, if a lease of metallic machines, for example, expires while a lease of lasting machines is still in force, the lessee is required to renew his lease of metallic machines so that he can fulfil his obligations under the lasting machine lease. Thus, the brief writer concludes, the lessee must continue indefinitely to use the United Company's machines. We have shown above (*supra*, pp. 17–20) that not only is this contention of the United States untrue, but that the exact reverse of the contention is true. The Full Capacity Clause in the lasting machine lease, as in all other leases, requires the lessee to use the leased machines only on shoes on which he is permitted by his lease to use them. He is not permitted to use them on shoes which are not operated on by the United Company's metallic machines. He is not required, however, by his lasting machine lease, to use the United Company's metallic machines. Therefore, if he does not renew his lease of metallic machines (and he is not obliged to do so), he is free from any obligation to use his lasting machines. If he does desire to continue using his lasting machines and does not wish to renew his lease of metallic machines, he may change his restricted lease of lasting machines for an unrestricted lease and thus use the lasting machines with a competitor's metallic machines.

The contention of the brief writer is, therefore, wholly untrue.

7. The conclusion of the brief writer from the above is that the shoe manufacturer, being obliged by the Exclusive

Use Cancellation Clause to use the United Company's lasting machines exclusively, and, through the effect of the Restricted Use Clauses, to use the United Company's welter and stitcher, pulling-over and metallic machines exclusively, a situation is brought about in which competitors are excluded from dealing with this shoe manufacturer, and the United Company thereby becomes "absolute monarch of the industry" (p. 181).

We have shown above that it is entirely untrue that the shoe manufacturer, even if he has taken a restricted lease of lasting machines, and even if he has also taken leases, whether restricted or unrestricted, of his welter and stitcher, pulling-over and metallic machines, is required to use machines of these kinds exclusively.

But assuming this statement of the brief writer is true, would it be true that competitors would be excluded from doing business with the shoe manufacturer? If the shoe manufacturer in question takes all the machines he needs, of the classes above named, from the United Company, he will take only a very small portion of the total machines which he will require. For example, he will need only one welter, one stitcher, one pulling-over machine, one slugger, one loose nailer, and, if he takes a restricted lease of pulling-over machines, which are restricted to use with heeling machines, one heeler. In other words, he will take a total of 6 machines (Defs.' Ex. 230, R. Vol. 5, p. 442). All his other machines he can obtain from competitors, including his welt auxiliary machines, General Department machines, of which there are over 170 different kinds, McKay sewing machines (if he makes McKay shoes), lacing machines, eyeletting machines, treeing machines, buttonhole machines, machines for sewing uppers, and various other

miscellaneous machines for use in the 100-odd operations performed by machines in the manufacture of shoes (Defs.' Ex. 235, R. Vol. 5, p. 531).

It is open to competitors to supply him with all or any of these machines, which in variety of type and number far exceed the number he must, according to the brief writer, take from the United Company.

In view of these facts, is it quite fair for the brief writer, even if we assume that all his conclusions up to this point are true, to contend that the shoe manufacturer we have been considering is completely cut off from obtaining machines from competitors?

Summary of Specific Case Used by United States to Illustrate the Effect of the Leases.

The following is a summary of the situation in respect to the "specific case" used by the United States to illustrate the effect of the clauses in the leases:—

1. The writer says that a shoe manufacturer desiring an equipment of machines must take his lasting machines from the United Company because he cannot obtain them elsewhere. *This is untrue.* The writer says the shoe manufacturer must also take lasting machines because the payments for his pulling-over machine taken from the United Company will be nearly tripled if he uses other lasting machines. *This is untrue.* The writer says that his lease of lasting machines will contain an Exclusive Use Cancellation Clause which will require him to use the United Company's lasting machines exclusively. *This is untrue.* The writer says he must take a restricted lease of lasting machines because the unrestricted lease is commercially impossible. *This is untrue.* If he takes the No. 5 lasting machine on a restricted lease it will be restricted to use with the welter, stitcher, pulling-over and metallic machines. *This is true.* The writer says he will thereby be required to use not only lasting machines, but these other classes of machines exclusively. *This is untrue.* The writer says that on account of the effect of the Full Capacity Clause and the Restricted Use Clause he will, if his leases expire at different times, be required to renew them and thus remain indefinitely in the toils of the United

Company. *This is untrue.* By thus being obliged to use lasting machines, welters and stitchers, pulling-over and metallic machines taken from the United Company exclusively the writer says that the access of competitors to him will be cut off practically completely. *This is untrue.* Even if it were true that he had to use machines of these classes obtained from the United Company exclusively, which is not the case, he would still be able to obtain from competitors most of the machines in number and type that he requires in his factory.

Other Specific Cases.

The brief writer has naturally chosen a case which he thinks best illustrates the effect of what he alleges to be the Tying Clauses in the leases. We do not criticise him for this, but he has taken an unusual case. The ordinary shoe manufacturer, if he went to the United Company at all, would wish to obtain from it more than one kind of machine out of the many it makes. Normally he would take an entire series of bottoming machines, since they are especially constructed and adapted for use together. In such case the Restricted Use Clauses would not interfere with him at all. Even if he wished only a few kinds of machines from the United Company, it is very probable that they would not interfere with his taking such machines on restricted leases, and obtaining such other kinds of machines as he desired from competitors. The United States having stated a "specific case," it is only fair that we should state a few "specific cases."

If the shoe manufacturer wishes to make McKay shoes and wishes to take his lasting and metallic machines from

the United Company, he can take the hand method McKay laster, which is restricted to use only with metallic machines, and the metallic machines, which are restricted to use only with the lasting machines, and obtain all his other machines from competitors. The Restricted Use Clauses will not bother him at all. Take Jonathan Brown's factory as an illustration (Defs.' Ex. 236, R. Vol. 5, p. 671). He would take from the United Company 24 lasting machines and 18 metallic machines out of a total of 424 machines which the exhibit shows he has, and would take the remaining 382 machines he requires from competitors.

If the shoe manufacturer wished to obtain a welter and stitcher from the United Company, and to obtain all his other machines from competitors, he could take a non-initial payment lease of the welters and stitchers and obtain all his other machines from competitors. If he wished to add to these machines Goodyear auxiliaries, he could do so on the non-initial payment lease and still take all other machines from competitors. If he wished to add lasting machines, he could take the hand method welt laster on a restricted lease, restricted to use only with the welter and stitcher, and take all his other machines from competitors. If he wished to add the United Company's metallic machines, he could take them on a restricted lease, restricted to use with the welter and stitcher and lasting machine, and still obtain all other machines from competitors. If he wished also to take heeling machines from the United Company, he could take them on a restricted lease, restricted to use with the welter and stitcher, lasting and metallic machines, and still obtain all his other machines from competitors. If he wished to add General Department machines, he could, prior to the time the United Company stopped

leasing them at all, take them on restricted leases, restricted to use with the welter and stitcher, lasting and metallic machines, and still obtain all his other machines from competitors. If he wished in addition to take eyeletting machines from the United Company, he could take them on a restricted lease, restricted to use with the welter and stitcher, lasting, metallic, and heeling machines, and still take all his other machines from competitors.

If he wished to take various other combinations of machines on the restricted leases, he would be hindered little, if at all, by the Restricted Use Clauses.

We believe that the foregoing illustrates conclusively that the charge of the United States, that a shoe manufacturer desiring to take one or a few types of machines from the United Company is obliged, on account of the leases, to take practically all his other machines from the United Company, is without any foundation whatsoever.

For purpose of illustration some of the many combinations in which machines of the kinds which the United States sets forth in its petition as the "principal essential machines" may be taken from the United Company and from competitors for use in the manufacture of welted and of other kinds of shoes are set forth in an appendix to this brief, marked Appendix IV (*infra*, pp. 185–191).

Contentions of the United States as to the Independent Leases.

The brief writer states (p. 191),—

> "The defendants grant these leases [that is, unrestricted leases] only upon terms which, as a practical matter, prohibit their acceptance and coerce the manufacturer into taking the restricted form."

We believe the finding of the District Court that the charges for unrestricted leases are not shown to be excessive, the fact that many such leases are taken by shoe manufacturers, and the further fact that the amounts charged for the unrestricted leases are, on the whole, more favorable than those which were previously charged by the constituent companies for leases of much less efficient machines furnished without adequate service is sufficient answer to this contention (see Summary, pp. 118-122, Main Brief, pp. 359–360).

The brief writer says (p. 191) that the manufacturer to obtain any advantage from the unrestricted leases must take all his leased machines on such leases. This is entirely untrue (see our Main Brief, pp. 367–375).

We have shown that under many combinations the restricted leases would not interfere at all with the shoe manufacturer taking such other machines as he pleases from competitors, *supra*, pp. 34–36. Furthermore, it must be remembered that if the shoe manufacturer desires to use a competitor's machines of certain kinds, he would, of course, not take such machines from the United Company, and would, therefore, not make initial payments for them to the United Company. For example, if he only wishes to use the United Company's lasting machines, which is the "specific case" used by the brief writer to illustrate the effect of the leases, he will only take lasting machines from the United Company, and, therefore, only make the initial payments charged for lasting machines and obviously not the initial payments charged for other machines which he does not take from the company.

This fallacy that the shoe manufacturer must take all

the machines which the United Company puts out on unrestricted initial payment leases in order to use any machines obtained from a competitor underlies the entire argument of the brief writer. The figures he gives as to the amounts which a shoe manufacturer would be required to pay to use a competitor's machines are based on this fallacy.

The brief writer (pp. 191–192) begins with an example of a shoe manufacturer who takes restricted leases of the No. 5 lasting machine and of heeling machines, and an independent lease of metallic machines. The brief writer states that the manufacturer desires to use competing metallic machines and that his unrestricted lease of metallic machines does not assist him in doing this because his lasting and heeling machines are restricted to the metallic machines. Of course, the answer is that if he wished to use a competitor's metallic machines he would not take these machines from the United Company at all, and instead of taking restricted leases of lasting and heeling machines he would take those machines on unrestricted leases and would then be able to take all other machines from competitors.

At page 193 a general statement by Mr. Winslow is distorted to prove the contention that a shoe manufacturer wishing to substitute a competitor's heeling machines is required to place all his other machines on independent leases. Mr. Winslow said that such a manufacturer

> "could return our heeling machines, place his machines in the other departments upon the independent forms of leases, and continue to use the heeling machines of others" (R. Vol. 1, p. 443, lines 2–8).

What Mr. Winslow obviously meant was that he could take unrestricted or independent leases of any machines which were restricted to use with the heeling machines. Only a very few classes of machines are so restricted. The Goodyear, the metallic, the lasting, and the McKay sewing and General Department machines and others are not so restricted, so that he would not have to change leases of any of these machines constituting most of the machines manufactured by the United Company. This general statement of Mr. Winslow's is deliberately used to give a mistaken impression. The brief writer says of Mr. Winslow's statement (p. 194),—

> "And the statement seems to be in complete harmony with what the record shows of defendants' actual practice."

This is entirely untrue.

At pages 194–195 the brief writer proceeds deliberately to misconstrue and misapply the testimony of Mr. Winslow on pages 432–433 of the record in an endeavor to show that it would cost a shoe manufacturer making 1,000 pairs of welt shoes per day $8,833 to obtain unrestricted leases of machines and thus inferentially to use any machines of a competitor.

Mr. Winslow in his testimony was comparing not the cost of taking unrestricted or restricted leases, but the saving in installation charges to the shoe manufacturer in 1911 over what he was required to pay in 1899 for obtaining an equipment for the manufacture of Goodyear welt shoes (R. Vol. 1, p. 432, lines 18–22, 44–45; and p. 433, lines 1–12). His statement affords no foundation whatsoever for a comparison of prices charged for restricted and

unrestricted leases. This is shown by the fact that the greater part of the difference in cost between 1899 and 1911 came from the elimination of initial payments on Goodyear machines. As Goodyear machines are not restricted to use with machines of any other department, the shoe manufacturer desiring to use them and to take any or all his other machines from competitors is not required to take them on an initial payment lease.

At page 196 the brief writer says

> "... even if the shoe manufacturer did take the independent lease he would gain but little freedom, because every lease of the principal bottoming machines, except the McKay sewing machine, contains the 'Exclusive Use' clause, or its equivalent and all have the 'right to terminate all leases' clause."

This is a sample of the kind of argument made by the brief writer. Suppose a shoe manufacturer wishes to take lasting machines from the United Company and take all other machines from a competitor. His unrestricted lasting machine leases have the Exclusive Use Cancellation Clause and Cancellation for Breach Clause. The Exclusive Use Cancellation Clause merely provides that if he supplies himself with other lasting machines the United Company may cancel its leases of lasting machines. How can this possibly affect the shoe manufacturer's right to use other kinds of machines obtained from competitors? And the Cancellation for Breach Clause obviously has nothing to do with his use of competitor's machines of other kinds, as we do not think even the brief writer would contend that such a use of other kinds of machines gave the United Company a right to cancel its lease of lasting machines.

To a reader of the brief, however, unacquainted with the leases, the above quoted statement sounds plausible. An examination of the situation, however, shows that the statement is entirely fallacious and has been deliberately made by the brief writer to confuse and mislead the reader.

At page 198 the brief writer says,—

> "Assuming for convenience that these cumulative disadvantages to the manufacturer who tried the 'independent' lease amounted only to 4 cents a pair . . ."

it would mean a large annual sum, which the brief writer undertakes to estimate.

But the brief writer has no right to assume any such figure "for convenience."

The cumulative disadvantages consist only in the initial payments charged for the independent or unrestricted leases, and in the further fact that while no initial payment is charged for the clicking machine, though used entirely in connection with a competitor's machines, an increased payment is charged if used with a welter and stitcher and lasting machine not obtained from the United Company; in other words, in the case of the clicking machine a reduced price is charged when used as part of a series. To assume that a shoe manufacturer wishing to take any machines from a competitor would be obliged to pay 4 cents per pair additional to the United Company is without the slightest justification. In the "specific case" stated by the brief writer to illustrate the effect of the leases, the shoe manufacturer desired to take lasting machines only from the United Company. An unrestricted lease would cost him, not 4 cents a pair additional, but the sum of

$600 for his two machines. Such shoe manufacturer, having a total production of 250 pairs a day, could make approximately 75,000 pairs a year. The additional charge per pair of shoes for the first year would be only a fraction of a cent, and distributed over seventeen years would be almost infinitesimal.

The brief writer says (p. 198),—

> "The difference in the clicking machine royalties is alone sufficient 'as a matter of dollars and cents' to compel the choice of the restricted leases."

A reduced rate is allowed in the clicking machine lease when the machine is used with the United Company's welter and stitcher and lasting machine, that is, three machines out of the scores of machines which he needs in his factory. In other words, if he wants a clicking machine, and also takes these three other machines from the United Company, he gets the reduced rate. Even if the shoe manufacturer insisted on using the clicking machine (many manufacturers do not use it; for example Jonathan Brown, Defs.' Ex. 236, R. Vol. 5, p. 671), and even if he felt that he must obtain it at the reduced price, he would only be induced to take three additional kinds of machines from the United Company out of the large number he would require in his factory; and the welter and stitcher are not restricted to use with any other machine and he could take the lasting machine on an unrestricted lease if he so chose. He would, therefore, in such case not take a single restricted lease. And yet the brief writer asserts that the clicking machine royalty alone is sufficient "to compel the choice of the restricted leases."

Other Alleged Oppressive Provisions of the United Company's Leases.

At pages 187–190 of the brief of the United States the writer refers to "other oppressive provisions" of the leases. These are not alleged to be unlawful, but they are apparently referred to to show the power of the United Company in that it can compel lessees to accept leases with such provisions. The writer first objects to the clause providing that a lessee cannot, without permission from the lessor, remove a machine from his factory or, as the writer states it, from one of his factories to another. The United Company owns the machine and is paid according to its use. It obviously must know at all times where the machine is situated so that it can determine, if necessary, whether it is being properly cared for and to what extent it is used. Naturally the lease provides that the machine shall not be removed without the lessor's consent.

The next clause considered by the writer is the clause permitting the lessor to have access at all times to the machinery (p. 187),—

> " 'for the purpose of inspecting it or watching its use and operation, or of altering, repairing, improving, or adding to it, or determining the nature or extent of its use.' "

Obviously the United Company must have a right to look at the machinery in order to see if it is properly cared for and to see to what extent it is used so that it may be sure that it is paid the royalties due.

The brief writer construes this necessary right into an intention on the part of the United Company to

"enter the factory of the lessee at any time they please, and put themselves in a position to learn any manufacturing secret the lessee may have."

The brief then proceeds to say (p. 188),—

"Further, he [the lessee] is required 'at his own expense' to keep the machinery 'in good and efficient working order' although the machinery belongs to the lessor and the lessee is bound to pay for its use."

Could any argument be more absurd? The petition seriously charges that a clause requiring a lessee of machinery to keep it in efficient working order is an "oppressive" burden. Furthermore, the writer, of course, omits to state that this repair work is actually done by the United Company, except for the cost of new parts, and that the clause is not enforced (see Main Brief, p. 427).

He also objects (p. 188) to the clause requiring the lessee to pay a certain sum in case the machine is destroyed by fire; in other words, to insure it.

The attempt to show that these clauses are "oppressive" shows the attitude of counsel for the United States.

Attempt of the United States to Prove that Exorbitant Royalties are Charged.

At pages 188–190 of the brief the writer attempts to prove that exorbitant and excessive royalties are charged by the United Company.

There is no evidence in the record as to the market value of the machines which the United Company leases and

does not sell, nor could there well be, as they are patented machines which are unique and which have never been sold in the market.

The writer of the brief, however, finds that under Plaintiff's Exhibit No. 21, a lease of a No. 5 lasting machine, the lessee is required to pay the lessor $225 if the machine is destroyed by fire. From this he assumes that the machine is worth only $225. Even if $225 would compensate the United Company for the loss of the physical materials in the machine, which does not appear, this would be no test whatsoever of the value of the machine, the value of which consists almost entirely in the patented inventions which it incorporates.

For example, each new Model K welter probably saves $800 a year over the previous model (see our Main Brief, p. 545). To assume, as the writer of the brief does, that the value of such a machine is $225, being the cost of the physical materials in the machine, is absurd on its face. The pulling-over machine cost $1,000,000 to develop before it was made a commercial success (see Main Brief, p. 622). If the United Company sold the pulling-over machine, it would have to in some way add this amount to the selling price of the machine before it even received back its investment.

If the brief writer's contention were correct, a process patent which involves no physical materials, such as the Goodyear process patent, in *Rubber Co.* v. *Goodyear*, 9 Wall. 788, would have no value whatsoever.

In spite of this, however, the brief writer assumes that the value of the lasting machine is $225, and, therefore, that the value of all other machines is doubtless $225 apiece (p. 190). He then undertakes to show that royalties at

6 cents per pair would give a return of 120 per cent. per year on the value of these machines. He adds,—

> "No self-respecting business man would enter into stipulations so offensive and destructive of his liberty unless he was coerced by the circumstances surrounding him."

The conclusion may be true if the facts are true. We respectfully submit, however, that the reason new manufacturers who are under no obligation to the United Company take these machines in preference to others and agree to pay the royalties provided for is because the United Company's machines are so much more efficient than any other machines and such valuable service is rendered with them that they are worth more than the amount paid for them. Mr. Hazzard testified that the service rendered by the United Company was alone worth more than the royalties paid (R. Vol. 1, p. 644).

Certain Other Contentions in Respect to the Leases.

Contention as to Use of Additional Machinery Clause.

At pages 161–162 the brief writer under the title "Additional Machines Clause" quotes a clause from Plaintiff's Exhibit 30, a lease of Metallic Department machines. He calls this clause an Additional Machinery Clause and states that the clause appears in a current lease of metallic machines in spite of the statement by the defendants that the Additional Machinery Clause was abandoned in 1907 (see Main Brief, p. 324). The Additional Machinery Clause referred to by the defendants was a clause obligating the

lessee to take additional machines for any additional work (see Main Brief, p. 323). The clause quoted does not so obligate the lessee. It provides that he shall

> "either take from the lessor . . . additional machinery to perform the work, *or* in case the lessee does not thus lease additional Metallic machinery . . . , then the lessor may, if it so elects, cancel forthwith this lease and any other lease of Metallic machinery . . ." (italics ours) (R. Vol. 3, p. 281).

In other words, the clause provides that the lessee has the option of taking additional machinery or giving the United Company the right to take back its metallic machines. There is no obligation on him to take additional machines. For practical purposes the clause has much the same effect as the Exclusive Use Cancellation Clause, which provides that if the lessee supplies himself with other machines the United Company may withdraw its own machines of this kind. The clause quoted is used only in certain metallic leases.

Factory Output Clause.

At pages 167–168 the brief writer comments on the Factory Output Clause in the Goodyear lease. He charges that it requires the lessee to pay royalties on the shoes made on the United Company's machines and also on shoes made on competing machines. It is, in fact, only a charge for the United Company's machines based on the amount of work which they can perform (see Main Brief, p. 424). If the lessee wishes to obtain a lease without this provision, he can do so by paying an initial payment. The reasons for the adoption of this clause are given in our Main Brief (p. 424).

Contention as to Pulling-over Machine Lease.

At pages 177–178 the brief writer says that if a shoe manufacturer should do any of his lasting on machines supplied by any concern other than the United Company,—

> "his payments for pulling-over machines . . . would be nearly tripled" (P.'s Ex. 38, R. Vol. 3, p. 350, par. six).

If the lessee did not propose to use the United Company's lasting machines, he would take an unrestricted lease of pulling-over machines and his royalty would be ½ cent net per pair of shoes, for the use of both the principal pulling-over machine and the auxiliaries (P.'s Ex. 39, R. Vol. 3, pp. 363, 367).

The royalty under the restricted lease is comparatively simple to one acquainted with the industry, but complicated to explain to one unacquainted with the industry. There is first a provision that 2 8 of a cent net shall be paid for all shoes pulled over by machinery in the factory. There is a further provision that ⅛ cent net shall be paid for each auxiliary machine used. If a shoe manufacturer used two auxiliaries on a shoe, and he would seldom use more than two or three, his royalty thus estimated would be ½ cent net or ⅝ cent net. There is then a further provision that where all his shoes are lasted by the United Company's lasting machines, the total pulling-over royalty on all his shoes shall not exceed a maximum of ⅜ of a cent net. In other words, where the United Company gets the lasting machine royalty on all shoes made, the pulling-over royalty is not to exceed ⅜ of a cent over and above the lasting royalty. The result is that in figuring the maximum amount less may be charged for pulling-over where

the lessor also receives the lasting royalty on all his shoes. This is a mere case of a wholesale rate. If the lessee only used one auxiliary machine, or if he lasted part of his shoes by hand, he would not obtain any advantage under this maximum clause, but, on the contrary, the maximum so provided for might exceed the royalty he would otherwise pay (P.'s Ex. 38, R. Vol. 3, p. 350).

It clearly appears that in no case would a shoe manufacturer taking an unrestricted lease of pulling-over machines be called upon to pay triple the amount he would otherwise have to pay for his pulling-over machines, or anything like it. If he took the unrestricted lease of pulling-over machines, he would pay ½ a cent royalty, while the lowest possible rate he could pay under the restricted lease, if he used the United Company's lasting machines exclusively, and used one pulling-over auxiliary machine, would be ⅜ of a cent. He might under the restricted lease pay more than ½ a cent.

Brief Writer's Reference to Metallic Leases.

At page 166 the brief writer quotes a provision in the metallic leases requiring the lessee to purchase fastening material used in the machine from the lessor. At page 294 the brief writer states that in the Motion Picture case, 243 U. S. 502, it was held that such restriction was not a valid patent restriction.

Of course the brief writer must realize that this has nothing whatsoever to do with the present case which charges a monopoly of machinery, not of fastening material. An agreement that one of the United Company's machines shall be used only with fastening material obtained from the

United Company might conceivably give it a monopoly of fastening material, but could not possibly give it a monopoly of the machine. In fact, the restriction that certain material only should be used on the machine would tend to make it easier for competitors to furnish their own machines without this restriction.

The obvious purpose of referring to this provision is to prejudice the Court by attempting to point out that unlawful intent was expressed in this provision to obtain control of materials used in the machine. We respectfully submit that no such unlawful intent is shown.

In the first place, the United Company, in employing this provision, used a provision which, as stated in *Henry* v. *Dick*, 224 U. S. 1, had come to be regarded as a rule of property. Even if it has now been held that it is not a valid patent restriction, its use certainly showed no unlawful intent, but an intent to comply with what was then recognized to be lawful.

In the second place, the provision in the present case was not held to be unlawful in the Motion Picture case. That case merely held that the provision in that case was not a valid patent restriction, but left open the question of whether an agreement to this effect could validly be made with either a purchaser of the machine or a lessee.

The whole matter is outside of the issues in this case, but in view of the brief writer's reference to the clause we feel entitled to make the following brief explanation of the reasons for its use:—

The clause was employed by the McKay Company in its leases of metallic machines (P.'s Ex. 12, R. Vol. 3, p. 103). Lessees of metallic machines were asked to agree to use the lessor's fastening material for two reasons: The first

reason is, that such material must be of the proper size and character for use in the machines, or otherwise it may seriously injure them or cause poor work. As the machines belong to the lessor, it is of the utmost importance that proper material should be used. The clause in question thus protects the machine from injury. In the second place, under the lease system the lessee is so far as possible charged only for the amount of work he does on the machine. In the case of a metallic fastening machine the machine may be used for inserting only two or three slugs or fastenings in a shoe, or it may be used for inserting many score of slugs or fastenings. In other words, the number of shoes on which the machine is used does not show the actual amount the machine is used. If a definite sum were charged for each pair of shoes, a manufacturer who inserted two slugs would be charged too much and a manufacturer who inserted fifty slugs would be charged too little. The lessor, therefore, requires the lessee to obtain his fastening material from him and charges a price for such material which will give him a profit which is taken as royalty for the machine. This profit is directly proportionate to the amount of use which the lessee makes of the machine, and thus enables the shoe manufacturer to pay royalty only according to its use. The profit so obtained from the purchase of fastening material is the only royalty charged for the use of the machine.

It may further be noted that this fastening material is merely wire of a size and shape adapted to the machines. The total amount of such wire used in shoes is infinitesimal as compared with the total amount of such wire annually consumed in the country. It cannot possibly be contended that the United Company obtains any monopoly or has

any noticeable effect upon the trade in wire by this provision.

Alleged Punitive Action Against Disobedient Lessees.

Under the heading of "Punitive Action Against Disobedient Lessees" the brief writer (pp. 205–216) cites various instances in an attempt to show that the United Company has arbitrarily compelled shoe manufacturers to throw out competing machines. Some thirty instances are briefly referred to.

We submit that the statements of the brief writer are an attempt to impose upon the Court by distorting the testimony and by stating facts as though admittedly true, although they were denied or disproved by other witnesses.

An examination of the evidence relating to these instances as it appears in Appendix II of our Main Brief shows the unreliability of the statements in the brief for the United States.

In this reply brief we can only refer to a few of the instances mentioned. It may be pointed out, however, that in no case does the brief writer refer to the evidence contradicting his statement, and that in nearly half the instances the testimony to which he refers is the testimony of competitors who merely repeated hearsay statements made to them by shoe manufacturers whom they were trying to induce to use their machines, and that in some of these instances the shoe manufacturers themselves contradicted the testimony and in other instances, though called by the United States, they were not questioned as to the facts alleged.

The brief writer (pp. 215–216) makes the following statement:—

> "Kimball & Hadley of Lynn, Mass., were making needles and awls. Beginning about January, 1904, they found that they could not sell Universal Slugging Machine awls. Five firms told Hadley personally that the reason they would not purchase was that the use of their needles and awls was in violation of the lease of the United Company (Ptr.'s Ex. 24, par. 'Two,' III, 214, 216); and if they continued to use their needles and awls, the United Company would take its machines away from them (Hadley, I, 308, l, 11)."

It is true that Hadley did testify substantially as above stated. The record, however, shows that his statement was false.

In the first place, representatives of the concerns which he said made the alleged statements to him were called as witnesses and absolutely denied making any such statements (see our Main Brief, Appendix II, pp. 768–769).

In the second place, all the leases of the United Company have been introduced in evidence and there is not a single lease which requires the lessee to purchase awls and needles from the United Company. The lease referred to by the brief writer (P.'s Ex. 24, par. two) provides that the lessee shall obtain from the lessor

> "... all the duplicate parts, extras, mechanisms and devices, of every kind needed or used in operating, repairing or renewing the leased machinery, and the same shall form part of the leased machinery, and the lessee shall not otherwise make or allow to be made any addition, subtraction or alteration to, from, or in the leased machinery nor interfere with the proper operation of the same."

It is perfectly obvious that this clause refers only to such devices and parts as form a permanent portion of the

machine and that it does not refer to needles AND AWLS which are constantly used and replaced. The clause has never been so construed. The testimony of the shoe manufacturers that they did not say they must obtain needles AND AWLS from the United Company is undoubtedly true, and if they had made this statement, Hadley, who was acquainted with the shoe trade, would not have credited it.

Finally, it appears from the record that Hadley had sold out his business to the United Company, had later broken his agreements with them, and, in a suit brought by the United Company, was enjoined, and his contention that he was coerced into making the sale to the United Company being held untrue. (*United Shoe Machinery Co.* v. *Hadley*, 193 Mass. 351.) It was evident that he had acted dishonestly toward the United Company and was a prejudiced and biassed witness, determined to injure the company if he could, and that his statements were wholly unreliable. For further statement, see Appendix II to Main Brief, pp. 767–770.

At page 208 the brief writer states that W. S. Chase & Co. had installed two channeling machines and turn sewing machines and a heeling machine of the Haverhill Company, which were operated very satisfactorily, but that a year before the witness testified the Haverhill Company was told by Chase & Co. to remove all its machines because they were violating the conditions of their leases.

Chase's whole testimony was excluded on the ground that the transaction was subsequent to the filing of the bill. Mr. Winslow, however, testified that Chase & Co. were using the Haverhill Company's turn machine and heeler; that the United Company offered to let them return its turn machines and heeling machines and to keep

its lasting and metallic machines on the unrestricted leases, but they decided to keep the United Company's machines, and, therefore, gave up the use of the Haverhill turn and heeling machines (see our Main Brief, Appendix II, pp. 794–795).

The situation was that the United Company's turn and heeling machines, installed without initial payment and which the lessee had agreed to use to capacity, were not being used. The United Company, instead of insisting that they should be used, as it had a right to do, offered to take them back and thus enable the lessee lawfully to use the Haverhill machines, and, further, to change the restricted leases of lasting and metallic machines to unrestricted leases so that the lessee could use them with the Haverhill machines.

In other words, instead of forcing Chase & Co. to give up the use of the Haverhill machines, although such use did violate the Full Capacity Clauses, the United Company offered to waive this violation and arrange its leases of lasting and metallic machines so that Chase & Co. could use the Haverhill machines if they wished to do so.

At page 209 the brief writer says that Ned Pike, representing the Haverhill Company, detailed certain difficulties which he encountered in installing that company's machines. The brief writer says,—

> "He attempted to install a machine in the factory of Ashe, Noyes & Small, Auburn, Me., but they said that under their existing leases with the United Company it would be impossible to take the machinery without laying themselves open to a great deal of trouble with that Company."

Both Small and Noyes of this company, who dealt with Mr. Pike, testified in the case. Small testified,—

> "I did not make any statement to Mr. Pike which was at all to the effect that I would not put in his machines because of the existing leases with the United Company (R. Vol. 1, p. 804, lines 43–45).

Noyes testified:—

> "In my conversation with Mr. Pike nothing was said about the leases which we had with the United Company. They were not mentioned" (R. Vol. 1, p. 805, line 43).

We leave it to the Court to determine whether the brief writer has any justification for stating as a fact that these statements were made without referring to the fact that the persons alleged to have made the statements denied having done so.

We cannot in this reply brief take up all the instances of alleged "punitive action." The foregoing will illustrate the unreliability of the statements made in the brief for the United States. The evidence relating to these various instances is treated in Appendix II of our Main Brief.*

Appendices A, C, D, and E to the Brief for the United States.

Appendix A to the brief is a chart which purports to be "illustrative of the practical effect of exclusive use and tying provisions in restrictive lease and license agreements."

If used for this purpose it gives a wholly erroneous impression, especially to one not acquainted with the details concerned in the manufacture of shoes. For example, it would look as though a manufacturer taking heeling machines would be obliged to use the United Company's pegging machines, lasting machines, metallic machines, and Goodyear Department machines, because the ties in the chart run from heeling machines to these other departments. If he was a manufacturer of McKay shoes, the kind of shoes most largely made, he would not use pegging machines or Goodyear Department machines. If he took his heeling machines from the United Company, he would most probably wish to take his lasting and metallic machines because all three are adapted for use together. In any event the tie would run only to two other kinds of machines with which he is concerned in the manufacture of McKay shoes. If he wished to make turn shoes he would not use pegging machines, nor would he use the Goodyear stitcher, nor would he probably use lasting machines. The tie does not run to the Goodyear auxiliary machines or insole machines as appears to be the case according to the chart. It would thus run only to the Goodyear welter and not to any of the 43 Goodyear auxiliary machines or to any of the insole machines.

Again the chart naturally omits omission of the unrestricted leases. For example, if the manufacturer only

wished to obtain the eyeletting machines from the United Company he could by paying $100 get an unrestricted lease and then there would be no restricted clauses at all. This would entirely change the "practical effect" of the chart.

Again, certain statements in the chart are not correct. For instance, under heeling machines it is stated,—

> "Must use exclusively lessor's machines for all work for which machines in schedule are designed."

Presumably the brief writer refers to the Exclusive Use Cancellation Clause. We have shown above that the Exclusive Use Cancellation Clause has no such effect and this statement is entirely unjustified.

For further consideration of this chart see Appendix II to this reply brief (*infra*, pp. 176–179).

Appendix C purports to be a synopsis of lease forms showing the restricted clauses contained in each.

Appendix D purports to be a résumé of leases in which the objectionable clauses appear. It is inaccurate in various particulars. For example, it would appear from Section (11), p. 367, that the Full Capacity Clause applies to Goodyear auxiliary machines. While it is contained in the lease of the full set of Goodyear machines, it is expressly made to apply only to the welter and stitcher, which are the recording machines, and not to the auxiliary machines.

Appendix E to the brief for the United States is a table purporting to give the paragraphs in which the tying clauses appear in the leases. This also gives an erroneous impression. For example, it states that 10 leases contain the Additional Machinery Clause. It does not point out

that five of these leases are forms that have not been put out since 1907 or prior thereto, the Additional Machinery Clause having been eliminated and the remaining five leases referred to as containing this clause, all leases of metallic machinery, do not contain a clause requiring the use of additional machines, but merely contain a clause permitting the United Company to take back its machines if other machines of the same kind are used, which clause is erroneously referred to by the United States as an Additional Machinery Clause (*supra*, pp. 46–47). Appendices C, D and E are considered more in detail in Appendix III to this reply brief (*infra*, pp. 180–184).

THE CONTENTIONS OF THE UNITED STATES AS TO MONOPOLY AND AS TO THE NUMBER OF MACHINES PUT OUT BY SHOE MACHINERY MANUFACTURERS OTHER THAN THE UNITED COMPANY.

The United States contends that the United Company furnishes practically all of certain types of machines used in bottoming shoes.

But the United States nowhere in its brief contends that the United Company's machines are not patented or that they are not the best machines made. Nor does it anywhere contend that any other shoe machinery manufacturer furnishes service of the character furnished by the United Company.

There is not the slightest evidence that shoe manufacturers desire to obtain machines of these types as to which a monopoly is claimed from other shoe machinery manufacturers who are offering better machines and are prevented from doing so by the United Company.

There is therefore not the slightest evidence to dispute the following finding of the District Court:—

> "That the degree of success attained and the preponderance in number of users supplied which the United Company has secured are fully accounted for by the *superior efficiency* it has developed in its *patented machines* for work in combination with each other, together with the superior facilities it affords as above for their most efficient use, must be regarded *as shown beyond question.* It is not disputed that, when the petition was filed, its machines represented, in number and amount, *the highest*

> *development ever reached in the art* to which they belong; or that they are most in demand by manufacturers of the higher grades of shoes for that reason" (R. Vol. 1, p. 1137) (italics ours).

It, therefore, seems immaterial whether the United Company furnishes all or only a small portion of the types of machines in which it specializes.

Furthermore, the United States itself contends that the constituent companies which composed the United Company did at least as large a business in the kinds of machines which they manufactured as the United Company does to-day. It is admitted, therefore, that the United Company has not acquired a monopoly in these machines, except by taking over the business of the constituent companies, which, since they were essentially non-competing, the United Company was entitled to do as held in *United States* v. *Winslow*, 227 U. S. 202.

As to the other machines put out by the United Company since its formation, such as the pulling-over machines, clicking machines, eyeletting machines, and various new Goodyear auxiliary machines, it is not denied that they are nearly all machines which were created and developed by the United Company under patents, and that these machines have been in existence only a very short time. Whatever business the United Company has in these machines is presumably due to the fact that the United Company has created these machines and no one else has invented machines equally good. We submit that there is nothing in the evidence to refute this presumption that the business done by the United Company in these machines has been acquired lawfully.

While, therefore, the comparative amount of business

done by the United Company and its competitors would seem to be immaterial, nevertheless, the statements made by the brief writer in attempting to prove its contention that the United Company has

"pre-empted by combination and acquisition" (p. 151)

the field of bottoming machines and obtained practically a complete monopoly are so unjustified and its conclusions in certain respects so erroneous that we wish to call the Court's attention to certain of them.

In Appendix B, Part I, of the brief for the United States the writer purports to show the number of "principal bottoming machines together with clicking machines" which the United Company had out on March 1, 1911, and the number "which all competing concerns had out at that time"; that is, the Appendix purports to give the total number of these various machines in use in the United States on March 1, 1911. The reason this date is chosen is because Defendants' Exhibit 228 (R. Vol. 5, p. 430) gives the number of machines of various kinds which the United Company had out under lease on that date. A summarization of the Appendix is given at page 150 of the brief, reading as follows:—

Machines.	*By defendants.*	*By all others.*
Clicking machine	3,655	None
Pulling-over machine	1,632	None
Lasting machine	7,496	7
Standard screw machine	409	None
Pegging machine	146	None
Tacking machine	3,488	6
Welt sewing machine	2,527	142
Outsole stitching machine	2,676	758
Loose-nailing machine	1,835	24
Heeling machine	2,019	17
Slugging machine	1,876	23
McKay sewing machine	898	8

It is illuminating to note, in the first place, that this table refers to only 12 machines. The United Company manufactures approximately 300 different machines. In other words, the table represents only about 4 per cent. of the different types of machines which the United Company manufactures. An examination of the Appendix shows that the table has been made up as follows: The number of machines of the United Company outstanding has, with one or two exceptions, been taken from the Defendants' Exhibit 228 and is approximately correct. The number of machines of competitors is taken from statements of a few shoe machinery manufacturers who testified in the case as to the number of machines they had put out. In the first place, the brief writer himself admits that the shoe machinery manufacturers who testified only included a portion of the shoe machinery manufacturers in the country. For instance, in the Appendix under the heading "McKay Sewing Machine" (pp. 315–316) the names of nine manufacturers are given and it is stated that no representative of six of them testified. They are put down as having put out no machines. No reference is made to other manufacturers of or dealers in McKay machines at all. See also tacking machine, page 312, clicking machine, page 317. In the second place, practically none of the manufacturers who testified were asked what machines they had out on March 1, 1911. Furthermore, many of them did not testify at all as to the number of machines they had furnished and in such case they are put down in the Appendix as having furnished no machines. A glaring case of this appears in respect to eyeletting machines (p. 317). It is there stated in respect to the Peerless Manufacturing Company:

"Output not stated, but we may assume that if it was large enough to be significant it would have been stated by the defendants."

The writer of the brief, therefore, assumes that no eyeletting machines were put out by the Peerless Manufacturing Company, and makes up the list of the number of eyeletting machines out on this basis. As a matter of fact, Muther of the Peerless Company testified as follows:—

"We sell our eyeletting machines outright or loan them without charge to people who buy eyelets from us. . . . Our eyeletting machine is the Peerless rapid eyelet machine. It will insert any kind of eyelets in shoes. They are put out on loan leases and we ask customers to buy all their eyelets from us—but they don't. . . . We supply six or eight different kinds of eyelets, mostly japanned, which we buy and resell. We buy our japanned eyelets from the United Company and the Atlas Tack Company. . . . We can buy and sell all we want—all our customers require. . . . We sell more Atlas than United eyelets and our customers are altogether shoe manufacturers. . . . Our machines are sold to shoe manufacturers who use other machines obtained from the United Company. . . . Our machines and theirs are sometimes used side by side in the same factory. Manufacturers use either they want—or both" (R. Vol. 1, pp. 303–304).

The output of eyeletting machines thus described is designated by the United States as "None."

Furthermore, two of the witnesses, C. H. Jones and R. P. Hazzard, specifically cited by the United States to support its allegation of actual monopoly, use Peerless eyeletting machines. Hazzard, who picked out the United machines as generally the best on the market (R. Vol. 1, p. 653, lines 3–4) has five Peerless machines and only two United

machines (R. Vol. 1, p. 651, lines 5–9; Defs.' Ex. 262, R. Vol. 5, p. 707). Jones has five United eyeletters and ten or more Peerless eyeletters (P.'s Ex. 279, R. Vol. 4, p. 1559).

The Court will appreciate that a table purporting to show the number of machines out which is made up in this manner is absolutely and entirely unreliable and cannot possibly give a correct picture of the situation. That this is so is strikingly shown by the results in respect to McKay sewing machines.

The McKay sewing machine is one of the most important bottoming machines made. It was used in bottoming over 37 per cent. of the shoes made in 1910, while the welter and stitcher were used in welting and stitching only 30 per cent. of the shoes made in that year (R. Vol. 1, p. 424). Mr. Winslow gave a list of 17 American and 10 foreign dealers in and manufacturers of this machine (R. Vol. 1, pp. 858–859). Appendix B of the brief for the United States refers to the testimony of representatives of only 3 of these concerns. Emerson, of the Shawmut Company, testified that, a year before, his company had started to make a McKay sewing machine and had three machines out; "we are making . . . an improved machine of recent design" (R. Vol. 1, p. 910, lines 24–26, 33–35). Spencer testified that his concern had manufactured various machines and dealt in others. He did not include McKay sewing machines in the list of machines he manufactured and was not asked if he dealt in them (R. Vol. 1, pp. 884–885). Hall, of the American Worsted Machinery Company, testified that in the period from 1907 on the company did not manufacture McKay sewing machines, but that "we handled and made parts for that machine" (R. Vol. 1, p. 953, lines 21–22). He was not asked and did not state how many he had dealt

in. His company also quoted a price of $250 for a McKay sewing machine and was ready to make it for anybody (R. Vol. 1, p. 953, line 43; p. 954, lines 1–2).

The brief writer assumes that none of the other concerns named as dealing in or manufacturing McKay machines had put any out, and accordingly in Appendix B (p. 315) of his brief puts down 8 McKay sewing machines as the total output of all concerns other than the United Company, and in the table (p. 150) quoted above it is stated as a fact that a total of 906 McKay sewing machines were in use on March 1, 1911, of which the United Company furnished 898, and competitors only 8. Just why the brief writer chose 8 instead of 3, the number which Mr. Emerson testified he had put out, is not clear.

If the above were all the evidence in respect to McKay sewing machines, the unjustifiable method employed by the brief writer in making up the table would be made sufficiently clear. But it is not. It affirmatively appears in the record that in the Lynn district in 1909 there were 59 McKay machines supplied by the United Company and 367 supplied by others. In the principal shoe districts of the country 1,180 McKay machines out of a total of 1,488 McKay machines, or practically 80 per cent., were supplied by others than the United Company (R. Vol. 1, p. 977, lines 16–31).

John Bulmer, a witness for the United States, testified:—

> "McKay sewing machines are to be had from about all the shoe manufacturers. They pass through our hands more or less frequently, and we rebuild or repair them and furnish them to others. We have no difficulty in getting them at any time" (R. Vol. 1, p. 908, lines 38–41).

Mr. Jonathan Brown, a large shoe manufacturer, testified that there was no difficulty in buying all the McKay machines he wanted at any time (R. Vol. 1, p. 730, lines 18–22). He had 13 McKay sewing machines, only 3 of which he had obtained from the United Company (R. Vol. 1, p. 730, lines 23–25). The United Company never in any way interfered with his buying McKay sewing machines elsewhere (R. Vol. 1, p. 730, lines 26–30).

And yet, in spite of this evidence and in spite of the fact that this error was pointed out in our briefs filed at the first hearing in this Court, the United States in its present brief again states in this table that other manufacturers than the United Company had out only 8 McKay sewing machines in 1911. Brown alone had 10 of such machines obtained from others.

The Court can thus see what reliance can and should be placed upon the brief writer's statements.

We also call the Court's attention to the following comments on the machines, as to which, according to this table, the United Company has a monopoly.

The number of machines which it is stated in the table the United Company has out comprises all the machines of these kinds it or its constituent companies prior to its formation ever put out, which were still in the hands of shoe manufacturers on March 1, 1911. As the constituent companies at the time of the formation of the United Company furnished practically all machines of these kinds which were then in use, in discussing the amount of competition which now exists, the real question is how many machines have been put out by the United Company and by competitors during the last few years, and not what is the total number of machines put out by the United Company

and its constituent companies during the period in which the United States admits that the United Company or its constituent companies had a lawful monopoly of the business.

Considering separately each of the twelve machines enumerated in the table (p. 150):—

Standard Screw Machine. The United Company in 1900 had out 826 standard screw machines and in 1911 only 440. In 1913 this number was reduced to 379 (Defs.' Ex. 226, R. Vol. 5, p. 424). In other words, the United Company, instead of forcing other standard screw machines out of the market and substituting its own machines, had actually received back from lessees nearly half the number of machines which were outstanding in 1900. This was due to the fact that the manufacture of standard screw shoes has declined.

Pegging Machine. The United Company in 1911 had out only 146 pegging machines. It does not appear in the record how many were outstanding at an earlier period, but undoubtedly in 1899 many more were outstanding, since the manufacture of pegged shoes has rapidly decreased since that date and the number now manufactured is almost negligible (R. Vol. 1, p. 424).

Hamel makes a pegging machine and has put out one machine in the United States and three abroad (R. Vol. 1, p. 326, line 50). It is not surprising that he has not put out more machines during this period in which shoe manufacturers have been discarding their pegging machines instead of taking more; nor is it surprising that other shoe machinery manufacturers have not gone to the expense of developing these machines, when the total number desired in the country has been at most a few hundred,

when the supply of machines already constructed has been larger than the demand and when the United Company has been taking back machines instead of furnishing additional machines.

Tacking Machine. The table purports to show that the United Company had out 3,488 tacking machines and competitors 6. In 1900 the United Company had out 3,752 tacking machines and in 1911 only 3,065 of this same kind of machine (Defs.' Ex. 226). In the figure given in the table, of 3,488 there are included a number of hand tackers (Defs.' Ex. 228). But even accepting the brief writer's figure of 3,488 it shows that the United Company instead of increasing the number of its tackers outstanding in the last eleven years has actually reduced the number. There has, therefore, been no reason why competitors should do an extensive business in this field, since the supply of tackers already constructed has exceeded the demand, and certainly it cannot be claimed that the United Company has monopolized the business of others.

Clicking Machine. The clicking machine was invented by the United Company and put out in 1908. This machine cuts out the uppers from the side of leather. There are other machines and tools used for cutting out uppers (R. Vol. 1, p. 592, lines 41–45, p. 593, lines 1–6). This was the first machine invented to do the work in the particular way in which this machine performs it. The machine is protected by thirteen different patents, giving the United Company the exclusive right to make, vend, and use this particular type of machine (R. Vol. 2, pp. 2588–2598). No other clicking machine has ever been acquired, and no machine is restricted to use with the clicking machine, so that it cannot be contended that any shoe manufac-

turer is induced to take it by reason of the Restricted Use Clauses. The entire business of furnishing this particular type of machine has been created by the United Company since 1908 and the fact that no one else had furnished machines of this particular type in 1911 is if true, therefore, not surprising and yet this is one of the machines which the United States asserts has been unlawfully monopolized.

Pulling-over Machine. The pulling-over machine was invented by the United Company and was first put out in 1903. It is protected by nineteen patents (R. Vol. 2, pp. 2542 *et seq.*). When invented the machine performed work which had previously been done by hand and which is still done by hand in many shoe factories. The United Company spent in the development of this machine approximately $1,000,000 (see our Main Brief, p. 622). The United Company acquired one patent relating to this machine in 1900, when it was attempting to develop it, but it has never acquired a competing machine or the business of any manufacturer. There are no machines restricted to use with the pulling-over machine except the No. 5 lasting machine, a machine first developed in 1908 by the United Company. The work done by this machine can be done by other lasting machines. It is obvious that the business done by the United Company in pulling-over machines is due to the fact that it created the machine and the market for them, and no one else has developed an equally efficient machine.

Welt Sewing Machine. The table shows that the United Company has out 2,527 welt sewing machines and competitors only 142. In 1900 the United Company had out 1,338 welt sewing machines (Defs.' Ex. 226). It has, therefore, increased the number of machines out in eleven

years by only a little over 100 machines a year, although the number of welt shoes made in the country increased from 22,700,000 in 1898 to 86,231,000 in 1910 (see our Main Brief, p. 198). When the United Company was formed there was no competition. Competitors have been putting out the machine only for a comparatively short period, but have succeeded, according to the brief writer himself, in putting out 142 machines.

Outsole Stitching Machine. The United Company in 1900 had 1,193 outsole stitchers in use. In 1911 it had 2,676. In 1900 there were practically no competitors' machines out. There are now, according to the brief writer, 758 competitors' machines outstanding. In other words, although the United Company had practically the only machine of the kind in 1900, which was strongly protected by patents, and although its machine has ever since been admittedly the best machine made, competitors have in the last few years put out nearly 50 per cent. as many machines as the United Company has put out since its formation.

Slugging Machine. The United Company in 1900 had out 1,723 slugging machines which were increased to 1,878 in 1911, an average of only 14 machines per year. In 1910 to 1913 there was an actual falling off in the number of machines out (Defs.' Ex. 226). Hamel alone had since 1903 sold 22 slugging machines in the United States and 13 abroad (R. Vol. 1, p. 326).

Loose Nailing Machine. The United Company, in 1900, had out 860 nailing machines (Defs.' Ex. 226). In 1911 it had out 1,835. In other words, it had put out only an average of 100 machines per year during these eleven years.

Heeling Machine. The United Company had out, in 1900, 1,382 heeling machines. It had increased this in 1911

to 2,019, an increase of 637, or an average of 58 a year. Its heeling machine was admittedly the best, and it is the only concern whose heeling machines were being taken in 1899.

McKay Sewing Machine. The United Company had 898 McKay sewing machines in use in 1911. As we have shown, a considerably larger number of these machines had been furnished by others, although the table with gross error states that only 8 had been put out by others (*supra*, pp. 66–67).

Lasting Machine. The United Company had out in 1900 4,207 lasting machines. In 1911 it had out 7,496 lasting machines. The increase in these machines was due to the fact that when the United Company was formed about half the shoes made were lasted by hand. 2,080 of the machines outstanding in 1911 were of its new type of No. 5 lasting machine first developed by it in 1908. It is undoubtedly true that a comparatively small number of lasting machines had been put out by others. This was because the United Company's machines were vastly superior and the United Company had no larger proportion in 1911 than it had in 1899. It was, however, possible to obtain lasting machines from others, if any shoe manufacturer desired to do so (*supra*, pp. 24–25).

Other Statements in Respect to Amount of Business Done by United Company.

The brief writer lays great stress on the testimony of Warren F. McElroy, in which he undertakes to show his difficulties in equipping a factory to manufacture 600 to 1,000 pairs of welt shoes a day from sources independent of the United Company. In considering this testimony

it must be remembered that McElroy was attempting to manufacture only a particular type of shoe, viz., the welt shoe. Machines for manufacturing shoes constructed in this particular manner were invented by the Goodyear Company, and the United Company had specialized in this particular type of machinery. McElroy did not undertake to state that he could not readily obtain machinery for manufacturing other types of shoes which are the types most generally made in the country. For example, he testified:—

> "I did not look into the question whether a factory could be equipped for making McKay shoes without taking machines from the United Company.
>
> "More McKay shoes are made than any one kind. . . I did not consider whether McKay shoes or pegged shoes could be made without using United Shoe Machinery Company machines. I found that a factory could be equipped without using United Shoe Machinery Company machines for making metallic fastened shoes with heavy outsoles. Such shoes could not be made if light outsoles were used. . . . I did not consider whether a factory could be equipped for making turn shoes without the United Company's machines" (R. Vol. 1, pp. 193–194).

In other words, McElroy only attempted to get machines which imitated the work of the peculiar type of patented machines manufactured by the United Company.

Furthermore, it is important to note that McElroy did succeed in equipping a good-sized factory for making this peculiar type of shoe without obtaining machines from the United Company, and that he considered the shoe he made with these machines "a better shoe than the Goodyear welt" (R. Vol. 1, p. 194, lines 16–17).

In respect to the testimony of Long and Jones referred to at page 134 of the brief, to show that no other company

in the country "offer such a full line of machines," reference to the record will show that Long was testifying as to conditions in or prior to 1907 (R. Vol. 1, p. 231, lines 14–20) and that Jones testified merely that no "single concern, in this country to-day," except the United Company, could furnish a full line of machines for the manufacture of welt and turn shoes, the particular types of shoes in which the United Company specialized (R. Vol. 1, p. 115, lines 31–39). Further, he did not attempt to testify that machines for this purpose could not be obtained from two or more different concerns.

It is not true, as alleged in the brief for the United States (p. 152), that Mr. Winslow was unable to state "whether any one of the concerns which had been offered to the United Company and rejected by it was in existence on December 12, 1911, and was doing a substantial business in competition with the United Company." On the contrary, he had just named a large number of such concerns, and he said that he would have to examine the list in order to specify *all* that were then competing. Among those which he had previously described were many which, as shown throughout the record, are still doing a substantial competing business, such as the Boylston Manufacturing Company, the Champion Shoe Machinery Company, the Haverhill Shoe Machinery Company, the R. H. Long Machinery Company, and the Union Lock Stitch Company (R. Vol. 1, pp. 472–476; p. 572, lines 3–25; see also Appendix III of our Main Brief, pp. 808–834).

Again, Mr. Winslow did not admit, as alleged by the United States, "that the entire increase in welt machines and in lasting machines was in machines put out" by the

United Company (p. 154). What he did say was that the increase shown by Defendants' Exhibits 215 and 226 (R. Vol. 1, p. 424; Vol. 5, p. 424) was based only on the machines of the United Company, because, as Mr. Winslow distinctly stated, he had no reliable figures as to the number of competitors' machines (R. Vol. 1, p. 569, lines 37–44; p. 570, lines 20–40). Obviously, however, the fact that 86 welt and turn machines were put out by the Hamel Shoe Machinery Company, which started business in the United States in 1903 (R. Vol. 1, p. 326, lines 9–10; 37), and 65 (not *56* as given by the United States) welt and turn machines were put out by the Haverhill Company during the last two or three years (R. Vol. 1, p. 291, lines 42–44; p. 292, lines 7–10) proves that a considerable proportion of the increase in the number of welt and turn machines out was made by competitors of the United Company.

Misuse of Census Figures.

At the very beginning of the brief (p. 8) the writer attempts by a misuse of the census figures to create the impression that the United Company furnishes machines to practically all shoe manufacturers. Thus he says that the defendants leased machines to at least 1,033 shoe manufacturers, and in a footnote says,—

> "The latest figures of the census of manufactures (1914) show 1,090 firms, individuals, and corporations reported as engaged in the manufacture of 'footwear' operating 1,355 establishments."

The record shows that the United Company had 1,033 lessees in 1911 operating 1,150 different factories (R. Vol.

1, p. 454, lines 45–46; p. 455; p. 26, lines 38–40). The Census of 1914 was, of course, not in evidence and not compiled at the time the case was tried. Furthermore, it is, of course, unfair to compare the figures of the Census of 1914 with the number of lessees in 1911.

But further than this the brief writer himself misquotes the Census of 1914. It does not state that there were "1,090 firms, individuals, and corporations reported as engaged in the manufacture of 'footwear'" as alleged. On the contrary, it shows that the number of establishments was 1,355 and the number of "proprietors and firm members" 1,090. By the term "proprietors and firm members" the census report means individuals either singly or as members of partnerships owning or operating such establishments. This figure does not include corporations. Thus it does not purport to be a statement of the number of different concerns. We pointed this out in our reply memorandum filed at the first hearing in this Court, and as the census was not in evidence and the whole matter was outside the record we also stated in that reply memorandum that the census office, in answer to our inquiry, stated that the expression "proprietors and firm members" did not include or refer to 686 establishments operated by corporations or their employees. The present brief, in repeating the same error, deliberately misrepresents the situation.

We further pointed out that the term "establishment" as used in the census reports means usually a separate factory, but that where two or more factories are operated under a common ownership in one city they are counted as a single establishment (see Census of Manufactures: General Totals for the United States by Geographic Divi-

sions, States and Industries, p. 2). Thus the Census for 1914 would impliedly show that there were more than 1,355 factories making shoes.

In the footnote on page 8 the brief writer further says it should be remembered that makers of moccasins, infants' shoes, etc., are classed as making footwear, and that these do not need to use the essential bottoming machines which the United Company supplies. The record does not sustain any such statement.

The record shows that in 1911 the United Company did business with 1,033 shoe manufacturers operating 1,150 different factories. It further shows that the only evidence as to the total number of shoe manufacturers in the country in 1911, or at any other time, was Mr. Donham's testimony that he should say there were in 1911 between 1,300 and 1,500 and that the Census for 1910 showed in the neighborhood of 1,300, as he recalled it (R. Vol. 1, pp. 26–27, lines 41–42). At page 139 of the brief the writer refers to these figures and says,—

> "Census figures appear to include not only shoe manufacturers but producers of 'cut stock and findings.'"

This is not so. Producers of cut stock and findings are listed separately.

The result is that the record shows that there were 1,033 lessees in 1911 with whom the United Company did business and furnished one or more machines, and if it is fair to compare the census figures of 1910 with the number of manufacturers in 1911, there were at least 267 shoe manufacturers with whom the United Company did no business at all. As the census figures only list such manufacturers as make reports, it is probable that there were a larger number.

Conclusion

The brief writer does not attempt to deny that in a shoe factory only from 30 to 50 per cent. of the total number of machines used are of the kinds manufactured by the United Company (see Main Brief, pp. 603–604). As to a large proportion of these machines which the United Company does furnish no monopoly is claimed by the United States.

It further appears that a very considerable number of shoe manufacturers do not obtain their machinery from the United Company at all.

It finally appears that of the 12 machines (p. 150) on which the brief writer apparently finally depends to prove monopoly, several are machines very recently invented by the United Company, several others are machines the use of which has decreased so that the United Company has received back machines since its formation instead of putting out additional machines, and the few remaining machines (except the McKay sewing machine as to which it is clear the United Company has no monopoly) are machines invented by the constituent companies which formed the United Company as to which it is admitted these companies had practically a complete lawful patent monopoly in 1899, which have been vastly improved by the United Company under recent patents, and which are mainly of a type in which the United Company has specialized. Taken together the entire 12 machines constitute only approximately 4 per cent. of the total types of machines manufactured by the United Company, and a smaller percentage of the total types used in shoe manufacturing.

COMMENTS ON ALLEGED LASTING MACHINE COMPETITION.

1. PRELIMINARY STATEMENT.

The Court will find nothing in the brief for the United States which will raise any question as to the soundness of the findings of the facts bearing on this issue by the District Court, which heard in open court all the testimony discussed by the United States and whose findings show that they were made after thorough consideration of that testimony. Even if it be assumed that the facts were as stated in the brief for the United States, they fully justify the District Court's finding that there was no lasting machine competition in any practical sense between the Goodyear Company and the Consolidated Company. The United States does not deny that, as pointed out in our Main Brief (p. 114), there were only 248 of the Goodyear Company's Ideal machines out when the United Company was formed, as compared with a total number of between 4,200 and 4,300 lasting machines out, and on its own showing only 18 Ideal machines at the most were used on men's welt shoes. Nor does the United States deny that, as pointed out in our Main Brief (p. 122), there were only a few hand method welt lasting machines out in February, 1899, and that at that time the machine was only experimental and was unsuccessful. The alleged competition was so

trivial and so utterly unimportant that it is of no practical significance.

Accordingly we should not burden the Court with any further discussion of this issue than is contained in our Main Brief, pages 94–132, were it not for the fact that the brief for the United States does not, in our opinion, present its case fairly. It contains many inaccurate and misleading statements which to the reader of its brief only would give an entirely wrong impression of the evidence.

In the following pages we shall point out some of the misleading and inaccurate statements contained in the brief for the United States and we shall also call attention to some of the evidence to which the United States has neglected to refer and which disproves its contentions.

2. THE CONTENTION THAT THE EXPERIMENTAL HAND METHOD WELT MACHINE OF THE CONSOLIDATED COMPANY COMPETED WITH THE IDEAL MACHINE OF THE GOODYEAR COMPANY IN LASTING WOMEN'S WELT SHOES.

The brief for the United States contends (p. 23) that the problem of adapting the hand method lasting machine for the lasting of welt shoes was "in the way of solution in the fall of 1898"; and that in December, 1898, the Consolidated Company was "offering to the trade the hand method machine as a satisfactory machine for the lasting of welt shoes."

The United States relies upon Mr. Winslow's testimony that, as it is stated by the United States (p. 23), "some machines were already in shoe factories," that it was the intention of the Consolidated Company "to perfect the machine so as to make it an efficient welt lasting machine," that it became successful *in 1900*, and that *now* women's welt shoes are lasted very largely upon this machine.

It is upon these statements by Mr. Winslow that the United States bases its assertion (p. 23) that the Consolidated Company "was putting out lasting machines which covered the entire ground." But the United States ignores Mr. Winslow's testimony that, just before the United Company was formed,—

> ". . . while it is true that we had machines out it is true that *they were not being accepted by the manufacturers* and they were being sent out and coming back. We were trying all the time to keep them going. . . . We were trying to hold them in the field, but *we knew that they were not commercially successful*" (italics ours) (R. Vol. 1, p. 978, lines 2–5, 11–13).

Mr. Winslow also testified that "at the date of the formation of the United Company *it was not a successful welt lasting machine. It would not last the toes of the welt shoes properly*" (italics ours) (R. Vol. 1, p. 524, lines 9–11).

Mr. Winslow's testimony was emphatically corroborated by Mr. Howard (R. Vol. 1, p. 969, lines 4–6).

The practical reasons why the experimental hand method welt lasting machine was not successful until a new invention was incorporated in it in 1900 are fully explained in our Main Brief (pp. 119–121).

The United States relies on the testimony of Selz, Welch, and Strootman (pp. 33–35). But none of these witnesses

testified to any use of the hand method welt lasting machine on *women's welt shoes* prior to 1899.

Selz's testimony does not bear on the issue. In the summary of his testimony in the brief for the United States (pp. 33–34) women's *welt* shoes are not even mentioned.

Welch's testimony does not bear upon the issue of lasting machine competition in 1899, despite the attempt of the United States (p. 34) to give the impression that it does. Welch did not manufacture welt shoes until "along *in 1906*" (italics ours), *seven years after the United Company was formed*, and prior to that time had manufactured McKay shoes exclusively (R. Vol. 1, p. 711, lines 19–20, 34).

Immediately following its summary of the testimony of Selz and Welch the brief for the United States says (p. 34) that "the foregoing testimony shows" that the hand method machine was *in competition* with the Ideal "in the lasting of women's shoes *at the time the combination was formed*" (italics ours).

Strootman did not testify and the brief for the United States does not claim (p. 34) either that he was making women's welt shoes prior to 1899 or that he used the Consolidated hand method lasting machine prior to 1899. Accordingly his testimony is irrelevant to this issue.

The earliest date fixed by any of these witnesses as to use of the hand method welt lasting machine on women's welt shoes was 1906, after patented mechanisms had been added to the machine which made it successful.

The United States, therefore, has not called attention to any testimony whatever which could lead this Court to doubt the correctness of the finding of the District Court; on the contrary, it appears that all the testimony was

consistent with the finding that the hand method welt lasting machine "had not been made an article of commerce in any practical sense" when the United Company was formed (R. Vol. 1, p. 1130).

3. THE CONTENTION THAT THE IDEAL MACHINE OF THE GOODYEAR COMPANY COMPETED WITH THE HAND METHOD McKAY MACHINE OF THE CONSOLIDATED COMPANY IN LASTING McKAY SHOES.

The United States repeats the contention (p. 24), which it made for the first time at the former hearing in this Court, that the Ideal machine was used in the field of the hand method McKay machine in lasting McKay shoes.

The United States introduced no evidence in support of this contention and it now relies upon the testimony of only one witness, Mr. Howe. But the United States does not correctly state Mr. Howe's testimony. It says (p. 24) that Mr. Howe testified that "it would frequently happen that McKay shoes would be lasted upon the Ideal machine." What Mr. Howe actually said was:—

> "It would happen *sometimes* in a shoe factory whose principal work was the manufacture of women's welts that the concern might be making a few McKay sewed shoes, but not enough to have an appropriate lasting machine for them. In that case frequently *they would strain a point* and last their McKay shoes on an Ideal laster, *for which it really was not adapted*" (italics ours) (R. Vol. 1, p. 627, lines 25–31).

4. THE CONTENTION THAT THE IDEAL MACHINE OF THE GOODYEAR COMPANY WAS COMPETING WITH THE CHASE MACHINE OF THE CONSOLIDATED COMPANY IN LASTING MEN'S WELT SHOES.

A. Much of the Evidence Relied upon by the United States to show Use of the Ideal Machine on Men's Welt Shoes does not Relate to Use of the Ideal at all but Relates to the Copeland Rapid Laster, a Radically Different Machine which was Practically Obsolete in 1899.

The United States, after saying (p. 21) that "there can be no serious dispute with reference to the various kinds of lasting machines which were *being produced at the time the United Company was formed*" (italics ours), states that "at that time *there were on the market*" (italics ours), among other lasting machines, the Ideal and the Copeland Rapid, both owned by the Goodyear Company. That statement is contradicted by the testimony of Mr. Winslow which is cited as authority for it. Mr. Winslow said (R. Vol. 1, p. 521, lines 39–40): "The Copeland rapid laster *preceded* the Ideal, the Ideal being an improvement on it" (italics ours). Mr. Winslow also said (R. Vol. 1, p. 526, line 45) that the Ideal was developed from the Copeland Rapid laster and that (line 46) "in 1899 the Goodyear Company was *putting out the Ideal machine . . .*" (italics ours).

Mr. Winslow's testimony was confirmed by Mr. Howe, who said that the Ideal machine was developed from the Copeland Rapid machine and that after the Ideal machine was produced the Goodyear Company *put out the Ideal machine* (R. Vol. 1, p. 626, lines 36–43). The Ideal lasting machine was first put out in May, 1895 (R. Vol. 2, p. 2387). Worsencroft, a witness for the United States, said that the Copeland Rapid machine "was *succeeded* by the Ideal lasting machine" (italics ours) (R. Vol. 1, p. 914, line 1).

In a foot-note on the page following that on which it makes the misstatement above noted, the United States (p. 22) makes a tardy admission that the record does not show that the Goodyear Company continued to manufacture the Copeland Rapid machine after it produced the Ideal machine (see our Main Brief, pp. 106–108).

In order to justify its reliance upon testimony relating only to the Copeland machine the United States first undertakes to show that the Copeland and Ideal machines were substantially identical (pp. 21–22, 25). It characterizes the Copeland machine as "the same machine as the Ideal machine except that it was operated by the foot of the workman rather than by power" (p. 25).

On the contrary, it is shown conclusively by the testimony of both witnesses for the United States and defendants' witnesses (see our Main Brief, pp. 106–108), which the United States ignores, that the Copeland machine was *radically different* from the Ideal and was *practically obsolete* in 1899.

Accordingly the testimony of Florsheim and McElroy (Brief for the United States, pp. 25–26), which relates only to the Copeland Rapid Laster and does not mention the Ideal machine, is irrelevant.

Likewise, so much of the testimony of Worsencroft (p. 28) and Jordan (p. 31) as relates to the Copeland Rapid machine should be disregarded.

B. Evidence as to Use of the Ideal Machine on Men's Welt Shoes after 1899, largely relied upon in the Brief for the United States, is not Relevant to this Issue.

The United States fails to distinguish between use of the Ideal machine *before 1899* and use *after 1899*, as it in effect admits in the foot-note on page 25. As is shown in our Main Brief (pp. 110–113), the slightly increased use of the Ideal machine on men's welt shoes *after 1899* was due to the introduction of a new shape of last and to inventions which made it practicable for the Ideal machine to last men's welt shoes made on that last (and see *infra*, pp. 88–91).

It cannot be assumed that defendants in February, 1899, could anticipate either that change in the styles of shoes or the making of those inventions.

Accordingly, a considerable amount of the testimony which is relied upon in the brief for the United States is irrelevant. For example, Snow (pp. 26–27) testified *entirely* to conditions *after 1899*, in fact after "the spring of 1901" (R. Vol. 1, p. 896, lines 21–23). The testimony of O'Keefe (pp. 31–32) in regard to use of the Ideal machine related only to conditions *after 1899*. The testimony of Jordan referred to by the United States (p. 31) regarding use of the Ideal in the Douglas and Keith factories related only to conditions *after 1899*. The record does not show whether Murphy was testifying about conditions before

or after 1899, so that his testimony (p. 31) has no probative value. The greater part of the testimony of Heffernan (pp. 29–30) related to use of the Ideal machine *after 1899;* so did much of the testimony of Fletcher (p. 32).

Selz did not testify to any *use* of the Ideal machine. The testimony relied upon by the United States (pp. 33–34) was a mere expression of opinion and the value of that opinion may be judged from the fact that Selz made the ridiculous statement that the machines which he had mentioned—and he had included the *McKay-Copeland* machine, admittedly used only on heavy, nailed shoes such as brogans—could *all* be used in lasting *women's shoes* (R. Vol. 1, p. 142, lines 10–18).

In the foot-note on page 25 the brief for the United States says that it is immaterial whether the use of the Ideal machine on men's shoes was before or after the formation of the United Company, "the issue being whether such use *was possible*" (italics ours). That is of course *not* the issue, it being admitted that such use was *possible* (see our Main Brief, pp. 103–104). The issue is whether at the time the United Company was formed the Ideal machine as then constructed—not as later improved by inventions then unforeseen—was adapted for use on men's shoes under conditions then existing,—whether, in the words of the District Court, it could be "relied on to work well with the heavier leather whereof men's shoes are made" (R. Vol. 1, p. 1130). Evidence reviewed in our Main Brief (pp. 104–106) shows conclusively, and the District Court found (see our Main Brief, p. 117), that the Ideal machine was not adapted for successful commercial use on men's shoes when the United Company was formed.

C. The Attempt of the United States to Minimize the Importance of the Improvements which were Made in the Ideal Machine after 1899.

In pages 110–113 of our Main Brief, testimony is reviewed which shows that important improvements were made *after* 1899 which improved the mode of operation of the Ideal machine, making it more successful on men's shoes. These inventions were made by Stephen Snow, who testified as a witness for the United States. The brief for the United States endeavors to minimize the value of those improvements.

In its extended summary of Snow's testimony (pp. 26–27) the United States does not state his testimony fairly. For example, it says (p. 27): "Snow claimed that the Ideal machine would not last men's 'heavy' shoes 'successfully' without his inventions, but that they made it successful on those shoes." As authority it cites the record, Vol. 1, p. 898, lines 32–37, but at those lines Snow testified, *without qualification*, that the Ideal machine without his two improvements would not last men's shoes successfully.

The impression which the United States endeavors to give (p. 27) that Snow's testimony was only to the effect that without his improvements the Ideal machine was successful on all men's shoes except heavy shoes, such as brogans, etc., is not supported by his testimony. On the contrary, he said that before he made his inventions the Ideal would not successfully last *even patent leather shoes* (R. Vol. 1, p. 899, lines 38–42).

That the statement of Snow's testimony by the United States is inadequate and misleading is further shown by

the quotations from his testimony on pages 105–106, 111, 113 of our Main Brief. Snow testified that it was the two improvements which he made "that changed the machine from an unsuccessful machine into a successful one," and that without those improvements the Ideal *would not last men's shoes successfully* even if the operation were repeated two or three times (R. Vol. 1, p. 898, lines 35–40; p. 899, lines 38–42; p. 900, lines 12–13).

We do not see that any less weight should be given to the testimony of Snow, a witness for the United States, because it was in answer to "leading questions by counsel for the defendants" (Brief for United States, p. 27) *on cross-examination.*

But it is not necessary to rely upon Snow's testimony alone as to the value of his inventions. See the discussion in our Main Brief (pp. 106, 111–113) of the testimony of Fletcher, Whitman, and Heffernan, all witnesses for the United States, and the testimony of George E. Keith, the shoe manufacturer in whose factory the improvements were first used.

As to the statement in the brief for the United States (p. 27) that Snow "admitted that Ideal machines had been used by both Keith and Douglas in the practical manufacture of their men's shoes without the device," it should be noted, first, that Snow's testimony related only to conditions beginning with the spring of 1901 and that he expressly disclaimed any knowledge of conditions before 1901 (R. Vol. 1, p. 896, line 23; p. 899, lines 12–20) and, second, that while he was in Keith's factory from the spring of 1901 to the spring of 1902 he put holddowns on *all* of Keith's machines and he said that after he went to the Douglas factory, "I put them on as quickly as I could get

them on" (R. Vol. 1, p. 896, line 23; p. 897, lines 11–13; p. 900, lines 3–4).

In its summary of the testimony of Fletcher, a witness for the United States (p. 28), the brief for the United States ignores Fletcher's testimony, in the same paragraph as that to which it refers, that before the holddown, one of Snow's improvements was put on the Ideal machine, the machine did not operate properly, it was frequently necessary to repeat the operation and the shoes were likely to be injured (R. Vol. 1, p. 939, lines 1–9).

Jordan's testimony that the holddowns were used at Douglas's only a short time and were then taken off (Brief for United States, p. 31) is discredited by his testimony that when he worked on the Ideal machine at Keith's "they did not have the holddown on the machine," although he testified that he was operating an Ideal machine at Keith's at the time when the record shows conclusively that the holddowns were on Keith's Ideal machines (R. Vol. 1, p. 933, lines 18–22) (see our Main Brief, p. 111). Jordan's testimony is also contradicted by Fletcher, a witness for the United States, who testified that he worked for Douglas from 1902 to 1910 and that he knew that Stephen Snow "put holddowns on the Ideal machines in Douglas's factory" (R. Vol. 1, p. 937, lines 38–39; p. 939, lines 1–2).

In its discussion of the testimony of Heffernan (pp. 29–30) the United States endeavors to give the impression that Heffernan lasted men's welt shoes successfully for twelve years upon the Ideal machine without any holddown appliance, but testimony of Heffernan to which the United States does not refer, but which is reviewed on page 112 of our Main Brief, shows that before the holddown was

applied the work of the machine was not satisfactory and that his use of it could not be regarded as successful use. The United States also ignores the testimony of Heffernan that for over twelve years they had had the other improvement made by Snow on the machines in the factory where he was employed.

D. The Use of the Ideal Machine in the Field of the Chase before 1899, on the Showing Made by the United States, was Absolutely Trivial and Insignificant.

The contention of the United States that the Ideal machine of the Goodyear Company was used on men's welt shoes *before* 1899 in competition with the Chase machine of the Consolidated Company is supported by the testimony of only five witnesses, testifying to such use in only three factories. These witnesses were Worsencroft (p. 28), Whitman (p. 29), Heffernan (pp. 29–30), Jordan (p. 31), and Fletcher (p. 32), and the testimony of Whitman, Heffernan, and Jordan, so far as they testified to use before 1899, related to one factory only, the Whitman & Keith factory. The aggregate number of machines, to the use of which these witnesses testified, is eighteen at the most. The brief for the United States would give the impression (p. 32) that Fletcher said that Cushman had twelve machines before 1899, but he did not so testify (R. Vol. 1, p. 938, lines 28–29, 32–33). Cushman in fact had only six before 1899 (R. Vol. 1, p. 972, line 12).

It is shown by evidence referred to on page 114 of our Main Brief that the total number of lasting machines of

all kinds out on January 1, 1899, was between 4,200 and 4,300. The Goodyear Company had put out only 248 Ideal lasting machines altogether, and of that number eighteen at the most, on the United States' own showing, were doing work which could be done by any machine which the Consolidated Company was putting out. That is certainly a meager showing in support of the contention of the United States that there existed "vigorous competition" (p. 301) between the Goodyear Company and the Consolidated Company, particularly in view of the fact that the Goodyear Company had been putting out the Ideal machine for nearly four years. Clearly this trivial overlapping use of the Ideal machine was entirely insignificant and of no importance.

That the Ideal machine also did not offer any potential competition to the Chase machine is proved by the testimony reviewed in our Main Brief (pp. 104–106), where it is shown that the Ideal machine was structurally not adapted for lasting men's shoes.

5. THE CONTENTION THAT THE CHASE MACHINE OF THE CONSOLIDATED COMPANY COMPETED WITH THE IDEAL MACHINE OF THE GOODYEAR COMPANY IN LASTING WOMEN'S WELT SHOES.

The United States contends that the Chase machine was used in the field of the Ideal for lasting women's welt shoes. But none of the four witnesses relied upon by the United States, O'Keefe (pp. 31–32), Lemay (p. 33), Springer (p. 33), and Selz (pp. 33–34) testified to any such use, and only

two of them, Lemay and Springer, went so far as to express an opinion that the Chase machine could be so used, as is shown on pages 100–101 of our Main Brief.

The United States says (p. 22): "The Chase laster, according to Mr. Winslow, was used *chiefly* for lasting men's welt shoes" (italics ours). The implication contained in that statement is not justified. There was no qualification in Mr. Winslow's statements. He testified that "*the Chase was adapted for lasting men's welts and would not last women's welts*" and that "*it wasn't used on women's welts*" (italics ours) (R. Vol. 1, p. 399, lines 14–15; p. 525, line 15).

The United States relies (p. 38) upon an advertisement of the Chase machine "advertising that machine for the purpose of lasting women's shoes" (R. Vol. 1, p. 960, lines 28–31). But it should be noted that the advertisement did not purport to offer the Chase machine for lasting women's *welt* shoes. Presumably the advertisement had reference to women's McKay shoes on which the record shows a slight use of the Chase machine (see our Main Brief, p. 101). That use, however, was in the field of the hand method McKay machine of the Consolidated Company, not in the field of the Ideal, and evidence regarding it is not relevant to any issue in this case. Nevertheless the United States contends (pp. 38–39) that *these advertisements* show that the Chase machine "certainly" was "adapted to the lasting of *women's* welt shoes" (italics theirs) and therefore competed with the Ideal machine.

But not only does the record fail to show that the Chase machine was ever used in competition with the Ideal, in lasting women's welt shoes, but evidence entirely uncontradicted proves, first, that *it was never used in lasting*

women's welt shoes and, second, that *it was structurally not adapted for such use.* This evidence is reviewed in our Main Brief (pp. 100–103).

6. THE UNITED STATES HAS CALLED ATTENTION TO NO EVIDENCE WHICH IS INCONSISTENT WITH THE FINDING OF THE DISTRICT COURT AS TO THE ALLEGED COMPETITION BETWEEN THE IDEAL AND CHASE MACHINES.

The District Court, whose discussion of the evidence on this issue is quoted in our Main Brief (p. 117), held, after summarizing the evidence,—

> "I am unable to consider it established that competition in any practical sense was destroyed when the United Company became owner of both machines" (Dodge, J., R. Vol. 1, p. 1130).

So far from establishing that the finding by the District Court is manifestly wrong, the United States has not shown the facts to be otherwise in any respect than was found by the District Court.

It is perfectly evident that the purpose in combining the Consolidated Company and the Goodyear Company was not to eliminate competition, but to combine the welt machines of the Goodyear Company with the lasting machines of the Consolidated Company.

COMMENTS ON THE ALLEGED COMPETITION BETWEEN THE EPPLER COMPANY AND THE GOODYEAR COMPANY.

The United States has eliminated from its brief a number of the inaccurate, unfair, and erroneous statements which were contained in its brief at the former hearing and which were criticised in our reply brief filed at that time. However the brief still contains many statements of the evidence which are open to criticism. Besides persistently ignoring testimony of both defendants' witnesses and its own witnesses which is unfavorable to its contentions, the United States frequently makes statements which are not supported by the record and occasionally statements which are directly contradicted by the record.

Illustrations of the statements which we believe are open to such criticism, as we shall later explain more in detail on the pages indicated, are as follows:—

(1) The United States says in effect (p. 40) that the only reason why Eppler machines could not produce "Goodyear welt" shoes was "because 'Goodyear welt' was a trade-mark name for shoes produced on Goodyear machines." On the contrary, the record shows that it was because of the construction of the Eppler machines that they could not make Goodyear welt shoes (see our Main Brief, p. 139) (*infra*, pp. 96–98).

(2) The United States says (p. 42) that Whitman testified that the work done by the Eppler machine was satisfactory. In fact, Whitman made no such statement. The United States ignores his testimony that the Goodyear "did better work on the shoe" (R. Vol. 1, p. 916, lines 15–16) (*infra*, p. 100).

(3) The United States says (p. 45) that Cunningham testified "that the *welter* was satisfactory to him, but the outsole stitcher was not" (italics theirs). It ignores Cunningham's statement that "everything about the Goodyear was better" (R. Vol. 1, p. 289, line 19) (*infra*, p. 101).

(4) The United States says (p. 46) that Fletcher "made no comparison between the Eppler and Goodyear *welter* further than to say that they ran side by side in the same factory" (italics theirs). On the contrary, Fletcher testified that "the Goodyear welter was the best" (R. Vol. 1, p. 938, lines 2–3) (*infra*, p. 101).

THE CONTENTION THAT THE EPPLER COMPANY WAS AN ABLE AND A PROSPECTIVELY VERY DANGEROUS COMPETITOR.

1. The Record disproves the Claim of the United States that the Difference between the Eppler Welt Shoe and the Goodyear Welt Shoe was a Difference only in Name, and Shows that there was a very Limited Field for the Eppler Welt Machines.

While it is admitted by the United States—as all of the witnesses on both sides testified—that the Eppler

machines could not make a Goodyear welt shoe, yet the brief for the United States states (p. 40), as the *only* reason, the fact that "'Goodyear welt' was a trade-mark name."

On the contrary, as set forth upon pages 133, 139–140 of our Main Brief, the absolutely uncontradicted evidence shows that the difference between the Eppler welt shoe and the Goodyear welt shoe was not in *name* merely but rather in the actual *structure* of the shoe. As Mr. Howe explained, the Goodyear welt shoe

> "was the hand-sewed shoe, sewed by machinery. The Eppler welt shoe was a shoe made in a different way, different from what a hand workman would make it" (R. Vol. 1, p. 678, lines 25–28).

In the Eppler shoe, the bulky double thread of the inseam lay in a channel in the insole beneath the foot, while in the Goodyear shoe it is laid on the welt outside the surface on which the foot rests.

This bulky double thread in the insole of the Eppler shoe under the bearing surface of the foot had a tendency to raise a ridge on the insole which would cause discomfort to the wearer, but which, being inside the bottom of the shoe out of sight, might escape discovery by the ordinary purchaser until he wore the shoe. This defect in the Eppler shoe, most serious in thinner soles, made it impossible to use the Eppler welt machine for women's welt shoes or for turn shoes. For the same reason the Eppler machines could not be used to make shoes with reinforced insoles, either men's or women's; and about forty per cent. of all welt shoes are made with reinforced insoles (R. Vol. 1, p. 415, lines 41–43; Vol. 2, p. 2494).

On this evidence, entirely ignored in the brief for the United States, it was found by the District Court that

> "The Eppler machines were adapted to produce men's thick-soled welt shoes only" (Dodge, J., R. Vol. 1, p. 1131).

Accordingly the statement in the brief for the United States (p. 40) "that there was open to the Eppler Company *a wide field* of possible competition" (italics ours) is contrary to the record. It follows that the statement that the Eppler Company "was successfully entering that field" (p. 40) is also not supported by the record.

We shall later show (*infra*, p. 104) that the Eppler Company was not successful in the limited field which it was attempting to enter (see also our Main Brief, pp. 139–140).

The Court should not be misled by the statement by the United States (p. 40) that "Manufacturers using both kinds of machines packed the shoes made upon them together indiscriminately in the same case and sold them all as welt shoes." It is true that one witness (p. 46) testified as to a single factory that the shoes were all sold "as welt shoes," but he did *not* testify that they were packed "in the same case" (R. Vol. 1, p. 938, lines 7–10). That the shoes in that factory were all sold "as welt shoes" is wholly immaterial; of course the shoes were all "welt shoes," and as the seam made by the Eppler welter was entirely concealed in the finished shoe the purchaser would not become aware of the difference until he suffered discomfort in wearing the Eppler shoe (*supra*, p. 97).

2. Testimony of Shoe Manufacturers Relied on by the United States.

On pages 41–46 the United States summarizes the testimony of twelve manufacturers or shoemakers. Before pointing out specifically some of the misleading and inaccurate statements in those summaries of the testimony we call attention to the fact that on the face of those summaries the testimony of five of those witnesses, Jones (p. 41), Selz (p. 41), Smith (p. 42), Long (pp. 44–45), and Cunningham (p. 45) to the effect that the machines of the Goodyear and Eppler Companies were used for the "same work" or the "same purposes" means no more than that both machines were used to make welt shoes. For example, "the same purpose" was defined by Jones in regard to the welting machines as "for the sewing together of the welt, the upper and the insole of a welted shoe," and in regard to the stitching machines as "attaching the outer sole to the welt" (R. Vol. 1, p. 110, lines 38–46; p. 111, lines 11–18).

On the other hand, as fully explained in our Main Brief (pp. 145–146), seven of these twelve witnesses, all witnesses for the United States, testified that the work done by the Goodyear welter was superior to that done by the Eppler welter. These were Selz, Smith, Whitman, Strong, Keith, Cunningham, and Fletcher.

In its summary of the testimony of Smith, a witness for the United States (p. 42), the United States ignores his testimony that the Goodyear welter was superior to the Eppler welter because the bulky chain-stitch which the Eppler machine laid in the channel of the insole was

likely to form a ridge on the inside of the shoe, which would come against the foot and cause discomfort to the wearer (R. Vol. 1, p. 353, lines 4–20).

As to the testimony of Whitman, a witness for the United States, the brief for the United States says (p. 42) that he testified that the work done by the Eppler welt machine was satisfactory. Mr. Whitman made no such statement. He did say,—

> "I consider the Goodyear welt system the best system; it did better work on the shoe" (R. Vol. 1, p. 916, lines 15–16).

He also testified that his company never had more than one Eppler machine (R. Vol. 1, p. 916, lines 11–18).

As to the testimony of Field, a witness for the United States, the brief for the United States says (p. 42) that Field testified that his company "put in the Eppler machines because they regarded them as the better of the two." But Field, who did not install the machines until *1902*, also testified,—

> "The Eppler machine sewed a somewhat *looser and weaker seam* than the Goodyear" (italics ours) (R. Vol. 1, p. 931, lines 16–17).

Elsewhere in the record it is clearly shown that a *tight* seam "is indispensable in the inseam of a welt shoe" (see our Main Brief, p. 137). The United States also says (p. 43) that Field testified that it was his judgment "that the Eppler machine sewed a flatter seam than the old Goodyear." But this opinion was wrong, as is shown by abundant evidence and specifically by the testimony of Strong,

a witness for the United States, that "you get a flatter seam on the Goodyear welter" (R. Vol. 1, p. 932, line 25).

Strong, a witness for the United States, testified, according to the brief for the United States (p. 43), that he "got along" with the Eppler stitcher very well. The United States omits any reference to his testimony that

> "I think the Goodyear machines do better work than the Eppler machines. Of course, I think the Goodyear welter is better than the Eppler welter was" (R. Vol. 1, p. 932, lines 21–24).

As to the testimony of Cunningham, a witness for the United States, the brief for the United States says (p. 45) that he testified that the Eppler welter was satisfactory, but the outsole stitcher was not, ignoring his statement that he thought "*everything about the Goodyear was better*" (italics ours) (R. Vol. 1, p. 289, line 19).

As to the testimony of Fletcher, a witness for the United States, the brief for the United States says (p. 46) that Fletcher "made no comparison between the Eppler and Goodyear *welter* further than to say that they ran side by side in the same factory" (italics theirs). On the contrary Fletcher testified that:—

> "The Goodyear welter was the best" (R. Vol. 1, p. 938, lines 2–3).

He added that the Goodyear machines were substituted in the Douglas factory

> "because with the Eppler machine there was trouble with the loose seam. When you beat out the shoe there would be more or less looseness, which caused a weak seam. *It would make a bad shoe*" (italics ours) (R. Vol. 1, p. 939, lines 16–19).

The United States says (p. 42) that McElroy, a witness for the United States, testified that the Eppler welter "could have been used on women's shoes" (Brief for the United States, p. 42).

But the context shows that he meant no more than that as a mechanical operation it was possible to sew a woman's shoe on the Eppler machine, and that he did not mean to express any opinion as to the quality or salability of the shoe operated upon. He never used an Eppler machine and merely examined it once (R. Vol. 1, p. 187, lines 33–34; p. 188, lines 2–22). Moreover, McElroy had previously testified:—

> "*Q.* Do you know whether or not it could be used on women's shoes?
> "*A.* I do not" (R. Vol. 1, p. 188, lines 2–4).

No other witness even went so far as to express an opinion that the Eppler machine could be used on women's shoes, and for the reasons we have already stated (*supra*, p. 97) it never was used on women's shoes.

Little weight should be given to Long's testimony. His cross-examination (R. Vol. 1, pp. 246–276), including testimony regarding Eppler machines, shows that he was not a credible witness. Reference is made to some of his misstatements on pages 154–155 of our Main Brief.

3. The Contention that the Eppler Company had a Substantially Complete Line of Auxiliary Machines.

The brief for the United States says (p. 44) that Mr. Keith, formerly president of the Eppler Company, testified that the Eppler Company "had *a line* of machines for making welt shoes, *except* a rough rounder, and were trying to perfect that" (italics ours). It is plain that the United States intends to give the impression that the Eppler Company had a substantially complete line of auxiliaries, except a rough rounder. Accordingly this statement is absolutely unfair and misleading. Mr. Keith testified that the Eppler Company did *not* have "a full set" and named *only two auxiliaries*, the stitch separator and the rough rounder, stating that the rough rounder was not satisfactory and had never been perfected, and that the stitch separator was not satisfactory (see our Main Brief, p. 143).

On the other hand, uncontradicted evidence shows that the Goodyear Company had thirteen important auxiliary machines for welt work in 1899, including a successful rounding and channeling machine ("rough rounder"). Mr. Warren testified,—

> "The invention of the rounding and channeling machine revolutionized the method of attaching the outer sole" (R. Vol. 1, p. 793, lines 23–24).

4. The Contention that the Eppler Company was Successful and Threatened Serious Competition.

The United States claims (p. 41) that the Eppler Company was "an able and a prospectively very dangerous competitor." It asserts (p. 46) that the Eppler Company had been in business "some seven years before the consolidation," that it was "pressing its business and was advertising its product up to the moment of its acquisition by the United Company."

But the record shows that the Eppler Company was not successful. The fact that, despite the long time that the Eppler Company had been in business and the efforts it had been making to put its machines into factories, it had succeeded in installing only between thirty and forty welters —of which one-third were in the factory of the president of the company and others in the factories of the directors of the company—and a less number of stitchers (R. Vol. 1, p. 288, lines 31 *et seq.;* p. 388, lines 35–39; p. 389, lines 8–11; p. 931, lines 43 *et seq.:* Vol. 4, p. 1202) is certainly strong evidence both that the machines were unsatisfactory and that the company's business was not successful. Keith, the president of the company, testified that the Eppler Company had not been financially successful (R. Vol. 1, p. 392, lines 9–12).

This evidence also completely answers the arguments of the United States that the Eppler Company offered potential competition (pp. 40, 52). Disregarding the bearing upon possible future competition of the facts that all the Eppler machines infringed the Goodyear Company's patents and that eight infringement suits had been brought (see

our Main Brief, pp. 136–138), the evidence that the company after seven years of strenuous efforts had not succeeded in doing more than an insignificant amount of business and had not made any money proves that it did not offer even potential competition. For surely there had been ample time for the development of all the possibilities of competition that existed.

The United States tries to make it appear (pp. 54–55) that Mr. Howe considered the Eppler machines as among "the most efficient types of shoe machinery." To this end the United States purports to quote Mr. Howe's testimony, but it omits so much that the garbled extract is unfair and misleading.

Mr. Howe testified:—

> "We had acquired the Eppler Welt Machine Company, and we had acquired the directors' stock of the McKay Shoe Machinery Company and expected to acquire a large majority of their stock. Therefore we then had the most efficient types of shoe machinery—perhaps I should have said protected by patents—*in that* we had the *Goodyear* welt and turn sewing machines and a long line of auxiliaries, which were the only system or set of machines which would make the *Goodyear welts*, the *best* and most suitable shoe for any gentleman or lady to wear that was then known; we had the best heeling machines, best metallic fastening machines, all protected by patents; we had the best lasting machines. *If any manufacturer wanted to make Eppler welts*, we had the only system that would make them. Therefore that seemed to my mind at that time—the United Shoe Machinery Company did—to represent the control in one corporation of the most efficient types of shoe machinery" (italics ours) (R. Vol. 1, p. 630, lines 21–37).

We are unable to see that there is any foundation in the testimony above quoted and in the other testimony of

Mr. Howe quoted on page 55 of the brief for the United States for its statement (p. 55) that this testimony "demonstrates that the Eppler Company was an important actual and even more important potential competitor of the Goodyear Company."

The conclusion is certainly justified that the United States has not shown any ground for questioning the finding of the District Court as to competition, existing or threatened, which was offered by the Eppler Company. That finding was as follows:—

> "The evidence leaves me unable to believe that the possible field of competition between the two machines was large enough, or any actual existing competition significant enough in amount to warrant the conclusion that the acquisition by the United Company of both machines involved such destruction of competition as rendered it unlawful" (Dodge, J., R. Vol. 1, p. 1131).

THE EFFORT OF THE UNITED STATES TO MINIMIZE THE IMPORTANCE OF THE PATENT LITIGATION.

Referring to the large number of infringement suits which had been brought by the Goodyear Company against the Eppler Company the United States says (p. 50), "But it is to be observed that in only one of them was the essential mechanism of a principal machine directly involved."

On the contrary, *three* suits against the Eppler stitcher related to its shuttle mechanism, one of the most essential features of any lockstitch machine, while the suit on the welter involved much more than a "mechanism," since it

related to the fundamental mode of operation of the entire machine. We have pointed out the seriousness of this welter infringement in our Main Brief (p. 137).

The statement in the brief for the United States (p. 50) that this patent litigation was "abandoned in 1899 after lying dormant for years before that date" is contrary to the record. In nearly all of the suits testimony was being taken (R. Vol. 1, p. 674, lines 4–8). Seven of them had been started within about two years (R. Vol. 1, pp. 471, 674).

The United States offered no testimony to controvert defendants' proof of the above infringements.

THE CONTENTION THAT THE EPPLER COMPANY CHARGED A LOWER ROYALTY AND THAT A HIGHER ROYALTY WAS DEMANDED BY THE UNITED COMPANY AFTER THE ACQUISITION.

The brief for the United States says (p. 52) that while the royalty for the Goodyear machines was four cents a pair for men's shoes, "its competitor, the Eppler Company, charged only three cents." On the contrary, of the three executed leases of the Eppler machines which are in evidence, two (P.'s Ex. 59, R. Vol. 3, pp. 507, 509, 510 and Defs.' Ex. 269, R. Vol. 5, pp. 716, 718, 719) provided for a royalty of *four cents* per pair for men's shoes, while the third lease (Defs.' Ex. 44, R. Vol. 5, p. 54, a lease to the R. H. Long Manufacturing Company), as printed, provided (pp. 56–57) for a royalty of four cents, and a pro-

vision for a discount was written into the lease in red ink (R. Vol. 1, p. 250, lines 30–35). In the face of this documentary evidence it certainly cannot be successfully contended that the Eppler royalty was lower than the Goodyear royalty. And the testimony is to the same effect.

Mr. Winslow testified:—

> "There were *sporadic instances* of special rebates given by the Eppler Company, *but their regular rate was the same as the Goodyear*" (italics ours) (R. Vol. 1, p. 417, lines 33–35).

Mr. Howe confirmed this (R. Vol. 1, p. 470, lines 24–29).

That the United Company not only did not suppress the Eppler machines, but rather continued to put them out at the regular Eppler royalty of four cents per pair, so long as there was any demand at all for them, is shown by testimony referred to by the United States (pp. 43, 53; see also our Main Brief, pp. 154–156).

CONCLUSION.

The record wholly fails to show that the Eppler machines offered or were capable of offering real competition to the Goodyear Company or to throw any doubt upon the testimony of defendants that the real reason for the acquisition of the Eppler Company was to enable the United Company to start free from litigation.

COMMENTS ON THE ACQUISITIONS.

Under this heading on pages 67–104 the brief for the United States discusses thirty-six of the fifty-eight so-called "acquisitions." In respect to but few, if any, of these thirty-six transactions does the United States make an adequate statement of the facts established by the record. Specifically, it either ignores much important testimony favorable to the defendants or, when any reference is made to that testimony, the United States either omits any mention of testimony unfavorable to its contentions or fails to state it fairly. Its statements regarding these thirty-six acquisitions also contain many erroneous statements of the facts as shown by the record.

In Appendix I (*infra*, pp. 139–175), we have pointed out the erroneous or misleading statements by the United States and have called attention to important testimony which it has ignored.

Illustrations of the assertions by the United States which we criticise are the following:—

(1) It states (p. 91) that the United Company acquired from Joseph W. Leary "his business of *manufacturing* and dealing in shoe machinery" (italics ours). The record shows that Leary was doing *no manufacturing of any kind* (*infra*, p. 167).

(2) It further states (p. 92) that Leary "agreed to convey to the United Company all improvements which he should make within 10 years. . . ." In fact, Leary

made *no covenant whatever to assign any future improvements* (*infra*, p. 167).

(3) It states (p. 82) that the United Company acqtuired *the business* of Joseph P. Curtis, and (p. 92) that the United Company acquired *the business* of Zachary Taylor French. The record shows that neither of these parties was engaged in business and that the United Company *did not acquire any property from French and acquired only certain patent rights from Curtis* (*infra*, pp. 157, 167).

(4) It states (p. 88) that the United Company acquired the *business* of John Ritchie, and John Ritchie Company *relating to the manufacture* of metallic machines. The record shows that the Ritchie Company was engaged in the manufacture of *boots and shoes* and was *not* engaged in manufacturing machines (*infra*, p. 163).

(5) It states (p. 96) that Beaudry agreed to disclose "*all inventions* which he should thereafter make." The covenant was in fact *limited* to "heel finishing machinery, methods or devices," the subject-matter of the transaction (*infra*, p. 170).

(6) It states (p. 85), in respect to the first Booth Brothers transaction, that "Howard testified that the United Company was engaged in putting out a *perforating* machine which could be used for the same operation as the Booth machines, although he claimed that it was not *intended* for the same operation" (italics theirs). In fact Mr. Howard testified that the United Company's machine could *not* be used to do the work done by the Booth machine (*infra*, p. 159).

(7) It states (pp. 85–86), in respect to the second Booth Brothers transaction, that Howard testified that the United Company acquired "a fudge edge-making machine, a

wheeling machine, a stitch burnishing machine, an upper-shaping machine, and a *beating* machine" (italics theirs) and that he also testified that the United Company then had a wheeling machine and an upper-beating [beading] machine. Here the United States gives a wrong impression by telling only a part of the story. Mr. Howard testified that the United Company's wheeling machine was adapted only for a kind of work entirely distinct from the kind of work on which the Booth machine was used. He also testified that the United Company's upper beading machine was not satisfactory for light or medium work and that the Booth Brothers machine "was a much better machine for light work" (R. Vol. 1, p. 69, lines 12–13). The United States further ignores entirely the evidence that the United Company had no machines whatever for doing the work of the other two Booth machines (*infra*, p. 160).

At the start the United States misrepresents the general character of these transactions. It states that "the United Company acquired the *shoe machinery business* and assets of fifty-six individuals, partnerships, and corporations . . ." (italics ours) and that "The result of these acquisitions was to remove certain remains of competition. . . ." (Brief for the United States, pp. 67–68).

Both of these statements are contrary to the record.

As has been shown in our Main Brief (pp. 456–462), by nine of the transactions the United Company did not acquire any tangible property or any business of any kind, and by fifteen other transactions the United Company acquired nothing more than supplies of various kinds which are used by shoe manufacturers; so that by twenty-four transactions it did not acquire any shoe machinery at all.

And further, eight other concerns, from whom shoe machinery was acquired, were doing no business whatever; their machines were only experimental and were far from being adapted for commercial use.

The fact is, then, that instead of acquiring the "shoe machinery business" of fifty-six concerns the United Company did not acquire *any shoe machinery business from thirty-two of those concerns.*

As to the statement by the United States (p. 68) that "covenants were exacted from the vendors," where they were inventors, which "required assignment to the United Company of all inventions made during a period of years" and which were "designed to prevent future competition with the United Company," the District Court found that the covenants actually taken were no broader than necessary (R. Vol. 1, p. 1141). The necessity for covenants of the character actually used is pointed out on pages 491–495 of our Main Brief and the decisions holding that such covenants are normal and lawful are discussed on pages 495–500.

Following its belated admission (p. 68) that "in some cases what was purchased was patent rights and inventions and not machines," the United States says (p. 69), "A prospective competitor is none the less such because he has only proceeded to the point of acquiring a valid patent under which to pursue competition at the time he is removed from the field by acquisition."

Of course the assumption that the inventor of an improvement on a shoe machine, who may be and often is a shoe operative or mechanic, is a "prospective competitor" is entirely unwarranted. He is no more a "prospective competitor" than many thousands of his fellow-workers.

On pages 69–104 the United States discusses specifically thirty-six of the "acquisitions."

Throughout its discussion of these transactions the United States persistently ignores evidence unfavorable to its contentions, which shows that every one of the transactions was a normal and reasonable step in the development of the United Company's business. Particularly in cases where the United Company had a machine of the same name as an acquired machine the United States fails to make any reference to testimony showing (1) that the acquired machine was adapted to do a kind of work which no machine of the United Company could do, or (2) that the United Company's machine was only experimental and needed the acquired inventions in order to make it commercially successful, or (3) that the acquired concern had patents which the United Company infringed or which barred the way to needed improvements in its machines. All such testimony is of course essential to a fair presentation of the facts regarding these acquisitions.

In Appendix I (*infra*, pp. 139–175) will be found comments on the specific statements which the United States has made regarding these thirty-six transactions. Those comments show that the statements by the United States give a wholly erroneous impression. By ignoring testimony unfavorable to its contentions, by stating half-truths or by making positive misstatements the United States has entirely misrepresented the character of these transactions.

In considering these transactions it should be kept in mind that, as pointed out in our Main Brief (pp. 187–190, 217–228), throughout the entire period, during which from time to time these acquisitions were being made, the

United Company was engaged in a remarkable development of the art of shoe machinery. It has improved practically all its machines by embodying new inventions in them. It is now putting out 172 different General Department machines which it has either developed or acquired since its formation in 1899. It has developed 150 entirely new machines, including 39 machines which perform work previously done by hand or not at all. Nearly all of these machines embody more than one patent; many embody a dozen or more patents on different parts of the machine. The inventions of 421 patents are embodied in the 150 entirely new machines which the United Company has developed.

The patents and machines acquired by the acquisitions were used in building up and perfecting this great number of new and improved machines and in improving patented machines which the United Company already had. Many of the so-called acquisitions involved only the purchase of a single patented invention to be used with a number of other patented inventions produced by the United Company in perfecting some one machine. The acquired machines and patents were of insignificant importance compared with the machines developed and the inventions made by the United Company itself. On page 443 of our Main Brief will be found specific illustrations showing how the inventions of acquired patents have been combined with the patented inventions which have been developed by the United Company.

COMMENTS ON THE PLANT ACQUISITION.

In its discussion of the Plant purchase (pp. 104–133) the United States fails to show the facts to be otherwise than as found by the District Court. Throughout this discussion, however, the United States has quoted or referred only to the testimony favorable to its contentions and has in the main ignored testimony which is unfavorable to its contentions. It has also made incorrect and misleading statements and has drawn unwarranted conclusions. It is important that these instances be called to the attention of the Court.

The Contention that Plant had a Complete Line of Shoe Machinery.

It is alleged in the brief for the United States (p. 104) that Plant had "developed a complete line of shoe machinery for manufacturing welt, turn, and McKay shoes."

McElroy, whose testimony is referred to by the United States in support of this allegation, does not mention turn shoes in connection with the Plant machinery. There is no testimony which shows that Plant had developed any machinery for making turn shoes, or that turn shoes were made by the Thomas G. Plant Company, the shoe manufacturing concern.

Moreover, in McElroy's testimony, quoted on page 112 of the brief for the United States, his statement that Plant's machinery was "a full line" is qualified by the statement "consisting of lasting, welting, stitching and leveling machines." He further admits in effect that he examined only "the essential bottoming room machinery."

And further, McElroy's testimony is discredited by Plant's own statement to McGaffee that

> "he didn't have any rough rounding machine" (R. Vol. 1, p. 781, lines 2–3).

Warren testified,—

> "The invention of the rounding and channeling machine [rough rounder] revolutionized the method of attaching the outer sole" (R. Vol. 1, p. 793, lines 23–24);

and that

> "Every manufacturer that I know of is using . . . the rounding and channeling machine" (R. Vol. 1, p. 793, lines 30–31).

And again, Plant had produced no pulling-over machine (R. Vol. 1, p. 792, lines 10–11), another of the "machines for preparing and attaching the bottoms to the uppers of shoes," the class of machines to which the United States has limited its charge of monopoly.

Eight other Plant machines, including important machines such as the heel seat dinker, stitch separator, and side laster, were either unfinished or regarded by Plant himself as experimental and the Plant shoe company was getting along in one way or another as best it could without these machines (R. Vol. 1, p. 791, lines 34–45; p. 792, lines 1–33; p. 814, lines 1–7. See also our Main Brief, pp. 517–519).

The Contention that Plant was Successfully Operating his Machines.

It is alleged in the Brief for the United States (p. 104) that Plant "was successfully operating his machines in the factory of Thomas G. Plant Company."

This allegation is entirely unsupported by the record. On the contrary, as shown in our Main Brief (pp. 520–524), the record establishes beyond a doubt that the Plant machines were not successfully operating in the Plant shoe factory.

The testimony reviewed on pages 520–524 of our Main Brief is also a complete answer to the argument made in the brief for the United States (p. 110) with reference to the use of the Plant machines in the Plant shoe factory.

The Contention that Plant had Contracts with Factories where his Machines could be Made in Large Quantities.

It is alleged in the brief for the United States (p. 104) that "Plant also had contracts with factories where such machines could be made in large quantities," and an allegation to the same effect is made on page 109.

The evidence fails to show that Plant had contracts with any factory for building any complete machine. He had merely made arrangements with a number of scattered machine shops for making the parts of the machines which he had constructed and installed in the Plant shoe factory.

As stated by Mr. McGaffee,—

"The parts were built in about every city where there was a machine shop, because *Plant did not have any factory big enough to build his own parts . . .*" (italics ours) (R. Vol. 1, p. 773, lines 25–27).

The Contention that Plant was Offering to Equip Other Manufacturers.

It is alleged in the brief for the United States (p. 111) that Plant had offered to install his machines in the factories of the Commonwealth Shoe & Leather Company and the Endicott-Johnson Company and "was prepared to furnish his machines to shoe manufacturers generally."

As shown in our Main Brief (pp. 514–515), Plant's offer to install his machines in those factories was made with the ulterior motive of forcing the United Company to buy him out, and it was so found by the District Court (R. Vol. 1, p. 1142).

Plant would not even permit Hazzard, a large shoe manufacturer, to look at his machines (see our Main Brief, p. 515).

The Contention of the United States that the Plant Machines were "Efficient Competitors of the United Machines in the Opinion of Experts."

In support of its allegation (p. 111) that in the opinion of experts the Plant machines were "efficient competitors of the United machines" the United States relies first upon the testimony of McElroy, Florsheim, Selz, and Jones, and then upon an inadequate and misleading statement of the testimony of Warren and Howe.

But the testimony of McElroy, quoted by the United States (p. 112), and its summary of Florsheim's testimony show that both of those witnesses testified as to the quality of the *shoes* operated upon by Plant's machines and that neither of them testified that the *machines* were efficient.

The brief for the United States says (p. 113) that Selz expressed the opinion "that the machines were capable of being used in the manufacture of men's welt shoes" and that Jones testified that Plant's machines were adapted for the manufacture of men's shoes as well as women's.

But on cross-examination Selz testified that he *questioned the strength of the Plant machines for making men's shoes* and that he had never seen them used for men's shoes (R. Vol. 1, p. 155, lines 33–45; p. 156, lines 1–3). And McElroy on cross-examination testified:—

> "To the best of my information those machines had never made any men's shoes for the market. *I questioned the strength of those machines for making men's shoes.* . . . If his machines had been used commercially on men's shoes the frames should have been stronger" (italics ours) (R. Vol. 1, p. 193, lines 16–18, 22–24).

But Jones is not a practical shoe manufacturer (see our Main Brief, p. 529), and his testimony is discredited by the testimony of Reed, the treasurer of Jones' Company, who had charge of the manufacturing of the shoes. Reed testified that he thoroughly examined the Plant machines in 1910, considered the question of equipping his factories with the machines and decided not to take them. He said,—

> "We thought that it would be too much of a risk, and that we should have to lower our standard of shoemaking" (R. Vol. 1, p. 720, lines 12–13).

Furthermore, Florsheim was a member of the Shoe Manufacturers' Alliance, and Selz and Jones were both stockholders and directors of the Boylston Company, a competing shoe machinery concern. Testimony showing in detail their prejudices is reviewed in our Main Brief (pp. 528–530, 40–41).

The United States quotes (p. 114) the testimony of Mr. Warren and Mr. Howe in support of this contention that the Plant machines were "efficient competitors of the United machines."

But the testimony of these experts which the United States quotes, so far as it is relevant at all to this issue, related on its face to the value of the Plant *inventions, not the Plant machines.* Warren's testimony as to the machines does not support the contention of the United States. For example, he testified:—

> "Generally speaking they were of such construction that *they would break and get out of order*" (italics ours) (R. Vol. 1, p. 794, lines 17–18).
>
> "And in looking over all these Plant machines we found by a careful examination that they were *faulty in construction, light in weight in places, and badly designed*" (italics ours) (R. Vol. 1, p. 790, lines 28–31).
>
> "These machines of Mr. Plant's, built as they were, in my opinion *would not have been commercially successful* to do work under the varying conditions under which machines have to be supplied to shoe manufacturers" (italics ours) (R. Vol. 1, p. 790, lines 15–18).

Mr. Howe testified that the Plant machines were

> "too light to stand commercial use for making men's work . . . were not strong enough for continuous use, in my judgment, on his own manufacture, women's welts" (R. Vol. 1, p. 688, line 44; p. 689, lines 8–9).

The conclusion is certainly justified that the United States has not shown any ground for questioning the finding of the District Court as to the character and capacity of the Plant machines. That finding also specifically answers the allegation of the United States (p. 252) that

> "the record clearly shows that the Plant machines were right indeed at the threshhold of extended competition with the United Company's machines."

The Court found that the machines were not commercially successful; that they were not adapted to produce men's shoes and were not satisfactory in making women's shoes; that they frequently broke down; that the cost of making shoes on them was distinctly greater and that they were not capable of profitable use, concluding,—

> "*Nothing is found in the evidence which affords reasonable support for the petitioner's contention that they were 'right at the threshhold of extensive competition with the United Company'*" (italics ours) (R. Vol. 1, p. 1143).

The Contention that the Defects in Plant's Machines could have been Easily Remedied.

It is alleged by the United States (p. 115) that "There is, however, nothing in the record to indicate that the defects [in the Plant machinery] were of such character as not to be easily remedied by the alterations and adjustments common in the practical working out of a project like Plant's."

There is no evidence in this record to support this assertion, but, on the contrary, there is a great deal of evidence, which is reviewed in our Main Brief (pp. 531–534), which

shows what a tremendous undertaking it is to transform experimental machines into successful, commercial machines. The United States points to the evidence that "Plant and his assistants were possessed of a very high grade of inventive genius" (p. 115), but it is common knowledge that inventive genius is frequently unaccompanied by mechanical genius and that many a successful inventor is not even able to construct experimental devices embodying his inventions,—much less produce successful commercial machines.

The Contention that the Subject of Negotiation was Plant's Entire Line of Machinery rather than his Inventions.

In the brief for the United States it is alleged (p. 115) that "during the entire negotiations nothing was talked of but the buying of Plant's *entire* line of machinery" (italics theirs), as distinguished from the particular inventions.

As we have shown in our Main Brief (p. 513), Plant had no machines to sell; but assuming that he had, there is no evidence in the record in support of this assertion, and it is specifically contradicted by Mr. Winslow, who testified,

> "During these negotiations nothing except Plant's *inventions and patents* was the subject of discussion" (italics ours) (R. Vol. 1, p. 481, lines 12–13).

If the United States is endeavoring on page 115 of its brief to argue that the United Company should have bought only the inventions which it knew would be of value, it should be borne in mind, first, that particular

improvements could not have been singled out *during the negotiations* for the reason stated by Mr. Winslow:—

> "As to whether anything was said in our negotiations with reference to the purchase of those particular improvements, I didn't know what his improvements consisted of, as I have already stated. *I didn't know what he had or the value of his inventions* until I went up and examined them in September and had my experts examine them" (italics ours) (R. Vol. 1, p. 559, lines 28–33);

and, second, that the United States loses sight of the fact that the *United Company could only buy what Plant wished to sell.* It is quite obvious that Plant wished to sell all, and not a part only, of his inventions (R. Vol. 1, p. 486, lines 2–6; p. 487, lines 11–16).

The Contention that Negotiations with Plant were Affected by Western Manufacturers.

The United States alleges (p. 119) that "it is fair to conclude that Winslow and his associates were well aware that negotiations were going on between Plant and the shoe manufacturers, and that unless the United people were prompt in closing the bargain the shoe manufacturers would obtain the Plant machines and establish a vigorous rival of the United Company."

The United States asserts (p. 118) that Endicott knew "as far back as June, 1910," that the Western manufacturers were coming to examine the Plant machines and that as "a leading figure in the defendants' negotiations, [he] must have informed Mr. Winslow" (p. 119). This evidence merely shows that Endicott knew in June, 1910,

that these Western manufacturers proposed to or might examine the Plant machines. It does not show that there were any negotiations pending between the Western manufacturers and Plant for the purchase of his patents and, as a matter of fact, no such negotiations were pending. It shows at most that Plant had arranged or hoped to arrange to have these shoe manufacturers look at his machines, whether for the purpose of inducing them to use some or all of them, as he had suggested that Endicott should do, or for the purpose of selling them his patents, or for the purpose of getting their advice or criticism does not appear.

The evidence further shows that no attention was paid to the Western manufacturers, because the unquestioned evidence shows that after "Endicott knew" that they might examine the machines, Mr. Winslow, on four separate occasions, broke off negotiations which had been initiated by Plant, viz.: on June 23rd (R. Vol. 1, p. 577, lines 12–14), on June 27th (R. Vol. 1, p. 483, lines 11–12), on July 5th (R. Vol. 1, p. 484, lines 16–21), and on September 16th (R. Vol. 1, p. 486, lines 1–44).

Mr. Winslow testified:—

> "Mr. Plant had told me, I think on the evening of the 20th, that he was expecting the Western people in Boston. . . . I did not pay much attention to it because it did not affect me one way or the other" (R. Vol. 1, p. 488, lines 18–23).

This was the evening on which the Plant purchase was practically agreed upon. So far as appears this was the first information Mr. Winslow had that the Western manufacturers intended to examine the Plant machines. There is not the slightest intimation, however, that Plant then

told Winslow that any negotiations were pending for a sale to the Western manufacturers, and as a matter of fact none were pending. Plant had not made any offer to them so far as appears. His first proposition to sell to them was made after he had agreed to sell to the United Company, when he made them a proposition which he knew they could not accept. If they came to Boston with a view to purchasing the Plant patents, it was for the purpose of examining the machines, and opening negotiations, not for the purpose of closing any pending negotiations.

The United States has not shown any ground for questioning the finding of the District Court that the Western Manufacturers had no effect upon the negotiations (R. Vol. 1, p. 1144).

The Claim that Other Capitalists Contemplated Purchasing Plant's Patents.

The United States attaches much importance (p. 121) to the testimony of Mr. Herrick, one of the counsel for the United Company, in regard to an interview which he had with Mr. Wallace, president of the Central Trust Company of New York, at the request of Mr. Wallace. The United States presents this insignificant and unimportant incident in a wholly different light from that which is given by Mr. Herrick's testimony. The effect of that testimony is merely that Mr. Wallace was trying to see whether he could get the United Company to make an offer with a view, in case it did, of trying to buy Plant's patents at a lower figure and make something on the turnover. "They had

no idea of putting any money out" (R. Vol. 1, p. 613, lines 44–45).

The utter insignificance of this incident is shown by the following testimony of Mr. Herrick:—

> "Mr. Wallace said that he and this large international banking concern, which had an immense amount of influence, were seriously considering acquiring an interest in the Plant factory. *I did not believe him.* My reasons for thinking that Mr. Wallace did not mean what he said were, first, I knew Mr. Wallace; then he spoke in a perfectly easy, comfortable way about how he was going to do these things. I was convinced he did not know what he was talking about and that *all he had in mind was to see if he couldn't make a turn by getting a bid from the United Company and then dealing with Plant. He almost said so*" (italics ours) (R. Vol. 1, p. 614, lines 31–40).

The Attempt to Discredit Endicott's Testimony.

Under the heading "Endicott's Story" (p. 121) counsel for the United States discusses the participation of Mr. Endicott in the negotiations of Plant with the United Company and asserts (p. 124) "Endicott's maneuvers are difficult to understand. His story excites lively curiosity."

That the United Company was much pleased to welcome to its board of directors a man whose ability had created the greatest shoe manufacturing business in the world was perfectly natural. We are glad to note that here, as in other parts of its brief, the United States has modified somewhat the statements in its brief at the first hearing in this Court in which, for example, it said, "*His story excites curiosity and suspicion*" (italics ours) (First Brief

for the United States, p. 124). But the insinuations which even now the United States makes against a man of Mr. Endicott's standing are not creditable to the United States. They need no answer, but they are answered by Mr. Endicott's testimony, which is clear and straightforward throughout, and which is fully corroborated by Mr. Winslow (R. Vol. 1, pp. 479–487), Mr. Herrick (R. Vol. 1, pp. 602–615), and by Mr. Howe (R. Vol. 1, p. 683, lines 9 *et seq.*; p. 686, lines 34 *et seq.*).

The Contention that Defendants Showed Anxiety to Secure the Plant Machines.

The United States alleges (p. 120) that "The whole history of the transaction shows that the defendants were keenly alive to the importance of removing from their path so dangerous a competitor and were exceedingly anxious" to secure Plant's machines.

The record proves the contrary to be the fact. The evidence clearly shows that throughout the negotiations Mr. Winslow never made any offer to Plant, but that the negotiations were begun by Plant and renewed by him several times after Winslow had definitely broken them off (R. Vol. 1, p. 559, lines 16–18). The negotiations are reviewed in our Main Brief (pp. 564–574).

All the evidence as to the negotiations proves conclusively, not that Winslow was exceedingly anxious to get Plant's machines, but that Plant was exceedingly anxious to have Mr. Winslow get them.

The United States alleges (p. 121) that "defendants hastened to give Mr. Plant a check for $500,000," and finds significance in the fact that at the time the check was

delivered "not a document had been drawn." The evidence shows that, as Mr. Winslow testified:—

> "It was a part of the arrangement with Mr. Plant that if we accepted his proposition he was to be paid $500,000 and then the papers would be drawn" (R. Vol. 1, p. 488, lines 2–4).

Mr. Herrick testified,—

> "This payment was made because Mr. Plant insisted that there ought to be something paid on account, and Mr. Carr [Plant's attorney], as I remember it, named the figure" (R. Vol. 1, p. 607, lines 8–10).

The Contention that the Plant Improvements were of Little Use to the United Company.

The United States alleges (pp. 125–126) that "defendants' own witnesses show that however valuable the Plant improvements were to him as a present and prospective competitor of the defendants, they were of little use to the United Company."

There is absolutely no testimony of defendants' witnesses or any witnesses to the effect that the Plant improvements were of little use to the United Company. The evidence is all to the contrary. For example, Mr. Warren testified,—

> "I later told Mr. Winslow that the improvements on the welter and stitcher were worth all he gave for the entire property, and that was my opinion" (R. Vol. 1, p. 788, lines 8–10; p. 813, lines 6–9).

Our Main Brief (pp. 541–550) contains a full statement of the evidence of practical shoemakers as to the value of the stitcher and welter improvements. It is there

shown conclusively that these improvements resulted in machines which operate faster, turn out more work, do work of better quality, are more economical for the shoe manufacturer, and enable the operator to earn higher wages.

The United States quotes (p. 126) Mr. Howard's testimony with reference to the stopping mechanism of the Plant stitcher as follows:—

> " . . . *five* different inventors employed by the United Company were put to work upon the *problem* of providing a *commercially satisfactory stopping* mechanism . . . " (italics theirs).

What Mr. Howard really said is this:—

> " . . . five different inventors employed by the United Company were put to work upon the problem of providing a commercially satisfactory stopping mechanism which *could be incorporated* in the organization of the model K out-sole stitcher, which was then the standard commercial machine of the United Company" (italics ours) (R. Vol. II, p. 2297).

The United States also urges that the fact that the United Company changed and so much improved the mechanical constructions in which Plant had embodied his valuable welter inventions in adapting those improvements to its machine proves that those inventions, in themselves, were of little use to the United Company. But the United Company's welter in which the Plant improvements were embodied *was of different design* from the Plant machine, so that "the mechanical construction had to be entirely changed in order to apply it to our machine" (R. Vol. 1, p. 811, lines 40–43; Vol. 2, p. 2260). That in reorganizing these Plant mechanical structures to fit its machine the

United Company's inventors should make still further improvements was to be expected and was consistent with the constant improvement of its machines which the United Company is always making. But these improved mechanical structures in which the Plant improvements were embodied in the United Company's new welter *all contained the Plant inventions and were all covered by the Plant patents.* Typical broad claims of the Plant patents which cover the United Company's machine are quoted in the record (R. Vol. 2, pp. 2262–5). These Plant inventions are the heart and core of the welt holding, the welt cutting, the welt measuring, and the stopping and loop cast-off mechanisms of the Model K Welter by which the tremendous savings have been effected (Main Brief, pp. 544–545).

The extended use which the United Company has made of the Plant inventions and their great value to the United Company are shown by the evidence reviewed in our Main Brief (pp. 535–550).

As to this contention of the United States it may be of interest to refer to its claim (pp. 117–118) that the Western manufacturers were willing to pay $1,600,000 for only a *half interest* in Plant's patents and inventions, *not* including any interest in the Shoe Company. If the record supports that contention, the Western manufacturers were setting a value of $3,200,000 on the patents and inventions alone, and the United States cannot consistently claim that they were not worth the $2,500,000 which the United Company paid for them.

The United States has not called attention to any evidence which should lead the Court to question the finding of the District Court as to the value of the Plant inventions when combined with the United Company's patents (R. Vol. 1, p. 1145).

The Argument that the Shoe Machinery Art would have been Advanced by the Sale of Plant's Machinery to a Group of Manufacturers.

The United States contends (p. 125) that all that was necessary in order that the shoe machinery art might be benefited by the Plant improvements was "to permit the shoe manufacturers who were ready and anxious to purchase an interest in Plant's machinery to carry through their design."

There is uncontradicted evidence that there were 708 distinct cases of infringement of the United Company's patents of 37 Plant machines (Defs.' Ex. 273, R. Vol. 5, p. 733).

The sale of an interest to the shoe manufacturers mentioned would have in no way avoided such infringements. Furthermore it would not have permitted the combination of the United Company's patents with the Plant patents, and the consequent great advance in the art of shoe machinery which was the object and the result of the acquisition (see our Main Brief, pp. 576–577).

The Contention that the Avoidance of Litigation was not a Motive in the Plant Purchase.

In the brief for the United States it is alleged (p. 128) "that the avoidance of litigation was in fact an actuating factor in the transaction does not appear. In no part of the negotiations was it suggested that the defendants should buy out Plant in order to avoid litigation."

On the contrary, that both parties had in mind the

avoidance of litigation and that it was a factor in the negotiations is shown by the fact that *formal releases were exacted by both parties.* On September 23, 1910, the United Company agreed to deliver to Plant releases "providing for the dismissal or discontinuance . . . without costs . . . of the suit now pending in the Supreme Judicial Court of Massachusetts . . . and suits now pending in the United States Circuit Court against said Plant . . . and . . . general releases including any and all claims . . ." (P.'s Ex. 132, R. Vol. 4, p. 935).

On the other hand, on September 30, 1910, Plant executed a formal release to the United Company of all claims, referring specifically to "certain suits" which he had planned to bring against the United Company (P.'s Ex. 137, R. Vol. 4, p. 1037).

The allegations of the United States are directly contradicted by the testimony of Mr. Howe and Mr. Winslow (see our Main Brief, pp. 559–561).

The United States finds it significant that (p. 125) "Defendants' witnesses talk of counter infringements by their machines. *But no litigation was begun by Plant*" (italics theirs).

It cannot be doubted that if Plant had kept on he would have enforced his rights under his patents and would have brought suits on account of infringement by the United Company's machines; indeed, as we have just stated, his intention to bring suits is asserted over his signature in a release signed by Plant on September 30, 1910:—

> "I . . . have made certain claims against the United Shoe Machinery Company . . . and have planned to bring certain suits against said United Shoe Machinery Company" (P.'s Ex. 137, R. Vol. 4, p. 1037).

Mr. Winslow and Mr. Howe fully expected that Plant would bring suits against the infringing machines of the United Company (R. Vol. 1, p. 862, lines 25–26; p. 877, lines 27–30; p. 878, lines 1–2).

Another important fact is that Plant had already defeated the United Company in six interferences. Twenty-three interferences had been declared in the Patent Office between patent applications owned by Plant and applications owned by the United Company. In six of these Plant had secured favorable decisions (R. Vol. 1, p. 846, lines 14–17; Defs.' Ex. 272, R. Vol. 5, p. 730).

The United States alleges (p. 128) with reference to infringement suits against Plant that "it does not appear that if any or all of them had been sustained it would have been fatal to the line of machinery owned by him."

A complete answer to this allegation is the evidence showing 708 distinct instances of infringement of United Company patents by 37 Plant machines, as set forth in Defs.' Ex. 273 (R. Vol. 5, p. 733). No testimony was introduced by the United States to refute these instances of infringement (see our Main Brief, pp. 541–542, 547, 551–553).

That these infringements were serious is apparent from evidence that it was the *general organization* of at least six Plant machines which infringed the patents of the United Company (Defs.' Ex. 273), and from Mr. Howard's testimony in respect to two other machines:—

> "The patents infringed by the Plant Heeler and the Plant Heel Attacher on Wood Lasts covered both these machines so thoroughly that by no possibility could they have been changed to avoid infringement. Plant's only course would have been to junk the machines and begin over again" (R. Vol. 5, p. 746, lines 27–31).

The conclusion is certainly justified that the United States has not shown any ground for questioning the finding of the District Court that the purchase of Plant's patents resulted in relieving the United Company of a burden of litigation threatening interminable controversy (R. Vol. 1, p. 1145).

The Contention that the Plant Stock was of Comparatively Little Value in the Transaction.

The United States asserts (pp. 130–131) that "The evidence does not show that the stock of the Plant Company was worth any such figure" as $3,500,000.

The evidence shows that the earnings of the Plant Company for the four years preceding its acquisition had averaged $738,000 annually. Plant owned and sold sixty per cent. interest in the stock of the company. It is shown in our Main Brief (p. 562) that 60 per cent. of the average earnings for the past four years amounted to $442,800 annually and that capitalized at 10 per cent. this would show a value of $4,428,000 for the stock which was acquired.

The United States asserts (p. 130) that "the statement furnished the company by Plant showed that the Plant Company had a net investment at that time of only $2,500,000 . . . 60 per cent. of which was $1,500,000." On the contrary, that statement (P.'s Ex. 132, R. Vol. 4, pp. 1014–1015) shows that the total net assets of the company were $4,358,955.51, of which 60 per cent. amounts to $2,615,373.30. As to the value of one of its assets, the trade-mark "Queen Quality" (R. Vol. 1, p. 603, lines 40–43), see *Thomas G. Plant Company* v. *May Company* (C. C. A. Sixth Circuit, December 4, 1900), 105 Fed. Rep. 375.

The District Court held (Dodge, J., R. Vol. 1, p. 1144):—

> "That it was of great value is shown beyond question by the dividends then and afterward paid on the stock acquired by the United Company."

The Contention that by the Plant Acquisition Control of Welters and Stitchers was Secured.

The United States alleges (p. 131) that by the Plant acquisition the United Company "again acquired substantial control of welters and stitchers."

The evidence relied upon in support of this contention of the United States proves that on the contrary a number of other concerns were actually engaged in putting out welters and stitchers, all of which were in business in 1910. These concerns are named in our Main Brief (pp. 611–612).

The Contention that the United Company Secured Control of the McKay Sewing Machine by this Transaction.

The United States asserts (p. 133) that by acquiring, as a part of the Plant acquisition, "the Stanley Company, which was putting out the original McKay machine" the United Company obtained "*complete control of that machine*" (italics ours). It asserts further (p. 133) that "Possibly second-hand machines can be obtained from dealers, but when that supply is exhausted *it will be necessary for every manufacturer to equip his factory with McKay machines held by the United Company*" (italics ours). This statement is

not supported by the record. In the first place Mr. Howe testified that the patents on the original McKay machine expired long ago and added that "anybody could manufacture them" (R. Vol. 1, p. 680, lines 23, 34–35). Mr. Winslow named twenty-six concerns from whom McKay sewing machines could be obtained, some of whom were manufacturing and supplying McKay sewing machines and some of whom were dealers. Representatives of only three of these concerns testified, being called by the United States. One of them, Spencer, testified that his concern went into bankruptcy in August, 1912 (R. Vol. 1, p. 884, lines 40–42); the other two testified that they were offering to supply new McKay sewing machines. Frank P. Emerson, treasurer of the Shawmut Machinery Company, testified that his company "began a year ago last July to manufacture McKay sewing machines, and put the first one out last June" (R. Vol. 1, p. 910, lines 15–17, 23–25). Emerson also testified:—

> "The McKay machine which we are making is an *improved machine of recent design*. We call it the most up-to-date McKay machine on the market. Formerly Walter Pearson was making it for us" (italics ours) (R. Vol. 1, p. 910, lines 33–36).

Bicknell Hall, another witness for the United States, president of the American Worsted Machinery Company until January, 1914, testified that that company had facilities for making the McKay sewing machine and that "we were ready to make that for anybody" (R. Vol. 1, p. 953, lines 1–6, 31–36; p. 954, lines 1–2). There are plenty of McKay machines on the market, and a number of concerns prepared to furnish new machines (*supra*, pp. 65–67).

CERTAIN CASES REFERRED TO IN THE BRIEF.

At page 255 the brief says,—

> "In *United Shoe Machinery Co.* v. *La Chapelle* (212 Mass. 467) the Supreme Judicial Court of Massachusetts applied the law to the facts of the case at bar."

At page 289 it says,—

> "The precise question of law involved in the present case was considered by the Supreme Judicial Court of Massachusetts in *United Shoe Machinery Company* v. *La Chapelle*, 212 Mass. 467."

The impression may be given by these statements that in the case referred to the Court found that the contentions made in this case by the brief writer were true. This is not the fact. In the La Chapelle case the defendant in the lower court offered to prove that the United Company was an unlawful monopoly in that it was an unlawful combination and in various ways had monopolized. The lower court ruled that such evidence was immaterial and declined to admit it. The sole question in the case was whether the facts alleged by La Chapelle in his answer to exist, which it is shown by the present case were not true, did show an unlawful monopoly and should have been admitted.

U. S. v. *United Shoe Machinery Co.*, 227 Fed. Rep. 507, was a decision on a motion for a preliminary injunction in a suit under the Clayton Act. *U. S.* v. *United Shoe Machinery Co.*, 234 Fed. Rep. 127, was a decision on motion to dismiss in the same case. In both decisions the Court

accepted the allegations of the petition as to the United Company's leases and their effect.

The brief at page 263 quotes certain statements in respect to the United Company's leases made by the Judiciary Committee of the House of Representatives in a report on the Clayton bill. The statements made in the report which he quotes are conclusively shown by the record in the present case to be entirely incorrect. They were made without hearing the United Company or examining its leases. The straits in which the brief writer finds himself to support his statements as to the leases are well illustrated by his resort to an *ex parte* report of a committee of Congress, not in the record at all, in an attempt to prove facts which are disproved by the evidence in the case.

Respectfully submitted,

FREDERICK P. FISH
CHARLES F. CHOATE, JR.
MALCOLM DONALD
of Counsel for Appellees

APPENDIX I.

COMMENTS ON STATEMENTS BY UNITED STATES AS TO THE VARIOUS ACQUISITIONS.

(NOTE.—The record references for the statements made in the following discussions, where not given, will be found in the statements in our Main Brief, Appendix I, to which reference is made in connection with each discussion.)

Goddu Sons Metal Fastening Company (Brief for the United States, pp. 62–65).

(The facts of this transaction with references to the record are set forth in our Main Brief, Appendix I, p. 657.)

The brief for the United States says (p. 69) that "The Goddu Company was engaged in *perfecting and manufacturing* nailing machines, slugging machines, tacking machines and standard screw machines—all important metallic fastening machines" (italics ours). This statement is not supported by the record. There is no testimony even suggesting that the Goddu Company was either "perfecting" or "manufacturing" any machines whatsoever.

The United States further says (p. 69) that the United Company "was putting out machines for doing the work for which the Goddu machines were *adapted*" (italics ours); and in support of the statement Mr. Howard's testimony is cited (R. Vol. 1, p. 42, line 1). What Mr. Howard actually said was:—

> "The United Company was putting out *commercial machines* for doing the work for which the Goddu Company machines were *intended*" (italics ours) (R. Vol. 1, p. 42, lines 1–3).

The record clearly shows that the Goddu machines were in fact not practically *adapted* for doing any work.

After quoting (inaccurately) a portion of the finding of the District Court, the brief for the United States (p. 70) makes the statement: "In any event, it appeared that the very thing the Goddus were doing was the perfection, by all necessary reconstruction, of their machines."

There is not the slightest evidence that the Goddu Company was making any effort whatever to perfect or to reconstruct its machines.

The brief for the United States says (p. 69) that "the Goddu machines, according to Winslow, were not yet in a condition to be placed in the hands of manufacturers for continuous operation, '*but* they were in a state of development where some of them could have been, without extensive changes, made operative'" (italics ours).

The record affords no authority for the "but" which we have italicized in the above quotation. What Mr. Winslow said was:—

> "Their machines were in a state of development and none of them, to the best of my judgment, was in condition to be placed in the hands of manufacturers for continuous operation. As I knew the situation, they were in a state of development where some of them could have been, without extensive changes, made operative" (R. Vol. 1, p. 436, lines 28–33).

By interjecting the word "but" between its paraphrase of Mr. Winslow's first sentence and the quotation from his second sentence the United States has given to the quotation a color which the record does not justify.

It will be observed that in the above paragraph the word "none" occurs at the beginning of the second line, while the word "some" occurs in a similar connection in the fifth line. The matter quoted was copied verbatim from the District Court record, and in the light of the first sentence it seems to us obvious that in the second sentence at the end of the fifth line the reporter substituted "*some*" for "none," the word which Mr. Winslow used in the preceding sentence. We hasten to add that we do not offer this suggestion by way of criticism and that of course the United States was entitled to rely upon the record.

The brief for the United States entirely ignores the uncontroverted testimony of defendants' patent expert, Mr Howard, who qualified also as a practical expert (R. Vol. 2, pp. 2239–2241) and who spent a week in 1898 in examining the machines of the Goddu Company, to the effect that the Goddu machines were "entirely impracticable." Mr. Howard stated in detail the reasons for his conclusions, and testified that remedying the defects

> "would have involved *entire reconstruction* of the machines, and *the machines so reconstructed would have been entirely different* from the machines as actually built by the Goddu Company" (italics ours) (R. Vol. 2, p. 2099).

It is submitted that the District Court was entirely justified in the finding, characterized in the brief for the United States (p. 69) as "the *contention* of one of the judges below" (italics ours), which was as follows:—

> "nor is the evidence sufficient for a belief that without reconstruction, radical in character, anyone could have used them as competing machines" (Dodge, J., R. Vol. 1, p. 1140).

The District Court's finding is quoted in full, *infra*, p. 144.

The brief for the United States says (p. 70) that the reason given by Mr. Winslow for this acquisition "was the disposal of patent litigation to which the United Company had succeeded as *plaintiffs*" (italics theirs). The United States ignores the testimony (Main Brief, Appendix I, pp. 658–659) showing that some time before the United Company was formed a suit had been brought by the McKay Company on Louis Goddu's contracts against Louis Goddu, his sons, and Albert Van Wagenen to compel a transfer of the Goddu Sons' patents to the McKay Company.

Louis Goddu, father of the "Goddu sons," had been employed as an inventor for many years by predecessors of the McKay Shoe Machinery Company; he had invented practically all of the metallic machines of that company and had been paid continuously for his exclusive services as inventor. Several years before the United Company was formed Louis

Goddu, all his sons, and Albert Van Wagenen all left the employ of the McKay Company and started the Goddu Sons enterprise, and the pending suit charged that they conspired to have Louis Goddu invent metallic machines, communicate such inventions to his sons, permit them to apply for patents and transfer those patents to the Goddu Sons Company. That suit had been vigorously contested and the claims of the McKay Company had been developed and substantiated before the acquisition. The brief for the United States ignores this litigation and refers only to the infringement litigation. It asserts (p. 70): "The disposal of such litigation could hardly be worth $150,000 to the defendants. The removal of an able competitor might well have been worth that amount." In view, however, of the great amount of litigation, both existing and prospective, and the very large expense which would undoubtedly have been involved as well as the great amount of time which would have been required of Mr. Winslow and his associates during the period when the United Company was just getting started, it is submitted that the consideration, for the objects stated, was not unreasonable. Winslow testified that he appreciated the time which would be required and the difficulties which would be encountered in establishing by the pending suit that the Goddu Sons' patents belonged to the United Company. He said he "had had considerable experience in that sort of litigation" and that

> "That arrangement was entered into on my part because of the fact that I very much desired to start the United Company free from all serious litigation" (R. Vol. 1, p. 435, lines 39–41; p. 437, lines 3–7).

The United States lays great stress (pp. 70–71) upon the testimony of Mrs. Converse, daughter of Albert Van Wagenen (R. Vol. 1, p. 311, lines 32–40; p. 312, lines 1–13), who was associated with Louis Goddu and his sons in the Goddu Sons enterprise and who was one of the defendants in the pending suit which charged a conspiracy, as above explained (*supra*, p. 141).

It should be noted, however, that in the statement which

Mrs. Converse testified that Mr. Winslow made he said that the Goddu Company

> "had no business and no machines . . . they couldn't raise money to go on with the business, and no manufacturers to take them" (Brief for the United States, p. 71).

Mrs. Converse also testified:—

> "He said to me that they hadn't anything, they weren't doing any business, they weren't a factor at all" (R. Vol. 1, p. 312, lines 40–42).

Obviously inconsistent with these statements is Mrs. Converse's testimony that Mr. Winslow said that he bought the Goddu Company to get rid of competition. And Mr. Winslow in his testimony specifically denied that he made the purchase to get rid of any competition, and also expressly denied that he made such a statement to Mrs. Converse. He testified:—

> "*Q.* Did you acquire the Goddu Sons Company for the sake of getting rid of any competition?
> "*A.* I did not.
> "I never stated to Mrs. Converse that we acquired the Goddu Sons Company for the sake of getting rid of competition" (R. Vol. 1, p. 437, lines 8–12).

With reference to the statement by the United States that Mrs. Converse's testimony was "supported by a copy of a contemporaneous memorandum" (p. 71), she testified that the memorandum was made "*about 1900 or 1901, I think*" (italics ours), and she also testified:—

> "I made memoranda of my conversation with Mr. Winslow while he was out of the room, *which I afterwards destroyed*" (italics ours) (R. Vol. 1, p. 312, lines 30–32; p. 313, lines 13–14).

It is submitted that in the light of Mrs. Converse's complete testimony her statement that Mr. Winslow said his purpose was to eliminate competition is entitled to no weight.

As above pointed out, Mr. Winslow emphatically denied both that he made any such statement and that he had any such purpose.

The statements in the brief for the United States (p. 71) that "The Goddu Company ceased to do business" and that "by this initial acquisition the prospective opportunity of shoe manufacturers to obtain metallic machines elsewhere than from the defendants was removed" are not supported or justified by the record. The Goddu Company did not *cease* to do business because they were not doing any and never had done any. "The prospective opportunity of shoe manufacturers to obtain metallic machines elsewhere than from the defendants" was not removed because there was no such prospective opportunity. The uncontroverted evidence which we have reviewed and which is set forth in more detail in our Main Brief, Appendix I (p. 657), shows conclusively that the Goddu machines were entirely unfit for commercial use and that to have adapted them for commercial use would have required entire reconstruction, so radical that if it had been effected the machines would have been entirely different.

We respectfully submit, therefore, that no reason has been shown why this Court should not accept as conclusive the finding of the District Court that

> "the metallic fastening machines acquired by purchase of a controlling interest in the company were none of them in the hands of users; their then state of development does not appear to have been such as made them capable of commercial use, whatever the merit of the inventive ideas they sought to embody; nor is the evidence sufficient for a belief that without reconstruction, radical in character, anyone could have used them as competing machines" (Dodge, J., R. Vol. 1, p. 1140).

Winkley and Phillips (Brief for the United States, p. 65).

(The facts of this transaction with references to the record are set forth in our Main Brief, Appendix I, p. 675.)

The brief for the United States says (p. 72) that the United Company acquired from Winkley and Phillips "their inven-

tions and improvements relating to 'sole leveling machines,' " and further says that defendants' witness Howard "testified that at the time of acquiring the above inventions or improvements the United Company was engaged in putting out sole-leveling machines, but that they were not of the same type as those covered by the inventions and improvements acquired."

The United States obviously aims to give the impression that the only difference between a machine embodying the acquired inventions and the machine which the United Company had before was that they were "*not of the same type*" (italics ours); that, however, they could be used for the same work; and that accordingly the United Company by this transaction acquired a potentially competing machine. With this purpose it has distorted Mr. Howard's testimony.

What Mr. Howard actually said was:—

> "Prior to the acquisition of these patents from Winkley and Phillips the United Company *was not engaged in putting out sole leveling machines for McKay work. It was putting out leveling machines for Goodyear shoes*, known among the trade as the Goodyear automatic sole leveling machine" (italics ours) (R. Vol. 1, p. 48, lines 9–13).

The United States also ignores the testimony which explains the practical reasons why McKay shoes and Goodyear shoes require entirely different kinds of leveling machines, as set forth in our Main Brief, Appendix I (p. 675).

The foregoing, in connection with other facts set forth in our Main Brief, Appendix I (p. 675), shows that by this transaction the United Company was acquiring, *not a competing machine*, but patented inventions relating to a machine for performing work which *could not be performed by the machine which the United Company had.*

Swain-Fuller Manufacturing Company (Brief for the United States, p. 73).

(The facts of this transaction with references to the record are set forth in our Main Brief, Appendix I, p. 684.)

The brief for the United States says (p. 73) that Mr. Howard testified that the Star leveling machine acquired in this transaction was "used *practically* exclusively on turn shoes" (italics ours) and that "the United Company was manufacturing and putting out a leveling machine, but *he claimed* that the United Company's machine was not adapted for leveling turn shoes" (italics ours). The United States apparently desires to give the impression that the Star leveling machine could be used on other work than turn shoes and also that Mr. Howard merely made a claim that the United Company's machine was not adapted for doing the work of the acquired machine.

What Mr. Howard said was that the Swain-Fuller Company was putting out "the Star leveling machine for turn shoes"; that

> "the Star machine *could not be used* with success or with commercial profit on other work" (italics ours) (R. Vol. 1, p. 53, lines 14–16, 21–23),

and that

> "At this time the United Company was not putting out turn leveling machines, and *it would be impossible to use any machine that the United Company then had on turn shoes*" (italics ours) (R. Vol. 1, p. 53, lines 19–21).

The United States ignores other testimony to the same effect, for example:—

> "The Star machine was a very light machine and was *adapted and used only for leveling turn shoes*, which, owing to the fact that they have but one sole, require and will stand a less degree of pressure than other types of shoes" (italics ours) (Howard, R. Vol. 2, p. 2063, Int. 1533).

Again, the United States refers (p. 73) to Mr. Winslow's testimony that by this transaction the United Company also acquired a "Single sole-molding" machine, but it does not refer to Mr. Winslow's statement in the next paragraph and on the same page of the record that

> "Neither of these machines was in competition with any machines then being made by the United Company" (Defs.' Ex. 231, R. Vol. 5, p. 455).

Carver Cotton Gin Company (Brief for the United States, pp. 73–74).

(The facts of this transaction with references to the record are set forth in our Main Brief, Appendix I, p. 725.)

The United States says (p. 74) that "Howard testified that among the machines obtained from the Carver Cotton Gin Company were the Acme leveling machine, a vamp skiving machine, and a machine known as the Davis leather-board skiver," and that at the same time "the United Company was putting out the Goodyear automatic leveler and the Emerson skiving machines, but that the acquired machine did not do the work *in the same way*. Even though this be admitted *the result accomplished was the same*" (italics ours).

The United States clearly intends to have it understood that at the time of this acquisition the United Company had machines which, while they did not do the work in the same way, would accomplish the same results.

This is entirely contrary to the facts. Mr. Howard testified that *the United Company had no machines for performing the operations performed by any of these Carver machines.*

Accordingly, instead of acquiring competing machines which would accomplish the same results although not in the same way, as alleged by the United States, by this acquisition the United Company was merely extending its line by adding machines which performed operations for which it previously had no machines.

At the end of its discussion of the acquisition of the Carver Cotton Gin Company the United States says (p. 74):—

> "By these three acquisitions the defendants acquired control of a machine needed in manufacturing all kinds of shoes. The leveling machine used in welt shoes is *now* put out only as an auxiliary machine (Dfts.' Ex. 231, V, 457). It can not be obtained for use with welt machinery supplied by any competitor of the defendants (I, 468, l. 34; 544, l. 10)" (italics ours).

The obvious purpose of the United States is to have it understood that by these three acquisitions the defendants acquired control of all the leveling machines and that as a result of these acquisitions the United Company is "now" following the practice of putting out its leveling machine for welt shoes "only as an auxiliary machine."

This is entirely unfair. The leveling machines acquired by these three transactions are all put out by the United Company through its General Department (Main Brief, Appendix I, pp. 676, 685, 728) and, therefore, have at all times been sold outright, although until recently they could also be taken on lease if the manufacturer desired; and the leveling machine for welt shoes has always been put out by the United Company in the same manner that it was always put out by the Goodyear Company, except that the United Company discontinued the initial payments. It should further be noted that the dates of these transactions were, respectively, March 16, 1900, February 2, 1901, and April 30, 1908.

That the United Company did not acquire any monopoly of leveling machines by these three transactions is shown by the lists of machines of competitors furnished for leveling McKay, welt, and turn shoes, which will be found in Defendants' Exhibit 235 (R. Vol. 5, pp. 587, 625, 664).

Seaver Process Lasting Company (Brief for the United States, p. 75).

(The facts of this transaction with references to the record are set forth in our Main Brief, Appendix I, p. 673.)

The United States alleges (p. 75) that the Seaver Process Lasting Company was "engaged in manufacturing *lasting* machines and *pulling-over* machines" (italics theirs), and that the Seaver Company was then insolvent. The United States further alleges that "The Seaver Company was the only company putting out lasting machines in 1899, except the Goodyear and Consolidated Companies," that "It has also a pulling-over machine; as had the United Company," and that no other pulling-over machine except the United Company's pulling-over machine is now offered by any American manufacturer.

The United States concludes (p. 75): "The result of this acquisition, then, was to remove the final vestige of competition in lasting machines, and to shake off the possibility of competition in pulling-over machines."

The United States ignores uncontradicted testimony showing that the Seaver Company's pulling-over machine was experimental and unsuccessful, but that it embodied inventions which are indispensable to a successful pulling-over machine and which have always since been embodied in the United Company's pulling-over machines; that the United Company's machine was then only experimental and did not become commercially successful for over two years after this transaction; that the Seaver patents barred the way to further development of the United Company's experimental pulling-over machine upon which hundreds of thousands of dollars had already been spent; and that that was the reason for the purchase.

The Seaver Company's lasting machine infringed two of the United Company's patents, and suits were pending. It was "unable to continue its business or to pay its debts" (P.'s Ex. 75, R. Vol. 3, p. 591). In another connection the brief for the United States admits (p. 22) that "The Seaver

149

Company had no plant and only one witness testified to any use of the Seaver machine." In all respects the Seaver machine was inferior to the United Company's lasting machines. Obviously, any competition which the Seaver lasting machine offered or promised was entirely negligible.

The only important fact is that the United Company acquired the valuable inventions which prevented further development of its experimental pulling-over machine.

Corrugated Wire Fastening Company (Brief for the United States, pp. 75–76).

(The facts of this transaction with references to the record are set forth in our Main Brief, Appendix I, p. 663.)

The United States alleges (pp. 75–76) that the United Company acquired a majority of the capital stock of the Corrugated Wire Fastening Company "*engaged in the manufacture and sale* of a tacking machine and corrugated wire" (italics ours). It further states that "Howard testified that the United Company had a machine for performing the *same* character of work as the one obtained from the Corrugated Company," but that "the machine was 'out of date'" (italics theirs). The United States says that this is discredited by Howard's further statement that the United Company continued to supply wire and parts for those machines and have parts in stock to-day. In other words, the United States aims to give the impression that the Corrugated Company was competing with the United Company.

But the United States does not fairly state the evidence. Mr. Howard testified that the Corrugated Company had formerly put out a tacking machine, but

> "*had not put out any of the machines for some years because it was completely out of date*" (italics ours),

and that

> "there was no longer any demand for the machines, so that no business was done and no business could be done with that machine";

and further that

> "the only business that was left when the Corrugated Company was acquired was the supplying of wire and spare parts for the machine" (R. Vol. 1, p. 42, lines 15–16, 28–33).

The fact that the United Company was still keeping in stock parts for that old machine was simply due to their practice of keeping spare parts on hand for old machines so long as there is one of them in use anywhere.

The business of the Corrugated Company was characterized by the District Court as "making wire and spare parts for use in an obsolete metallic-fastening machine" (Dodge, J., R. Vol. 1, p. 1138).

Globe Sewing Machine Company (Brief for the United States, pp. 76–77).

(The facts of this transaction with references to the record are set forth in our Main Brief, Appendix I, p. 685.)

The United States says (pp. 76–77) that Howard testified that the Globe Company was manufacturing a welting machine, an outsole stitching machine and an experimental rough rounding machine, and that "By this acquisition a possible competitor in welt method machines was removed." The United States also refers to the fact that the absence of a rough rounder is claimed by defendants to have been a weakness in Plant's line of machines.

The facts were that the Globe Company's machines were not successful; that they all infringed United Company's patents; that infringement suits were pending and that the Globe Company was in debt to an amount over $90,000. The United States omits to mention any of these facts.

The United States also ignores the evidence that the purposes of this transaction were to acquire control of patents which prevented development of one of the United Company's machines, to settle the existing patent litigation and to avoid further patent litigation.

Also the statement by the United States that Mr. Howard testified that the Globe Company was *manufacturing* its machines, the record shows that that company was not doing any manufacturing and that such machines as they had put out had been built by others under contract. It is entirely clear from the record that the business of the Globe Company was negligible and that its unsuccessful machines did not offer even potential competition.

Ross-Moyer Manufacturing Company (Brief for the United States, pp. 77–78).

(The facts of this transaction with references to the record are set forth in our Main Brief, Appendix I, p. 680.)

The United States aims to give the impression (p. 77) that the United Company was putting out machines for performing the same operations as the machines of the Ross-Moyer Company and that the Ross-Moyer Company was a competitor.

The fact is that with a single exception the United Company had no machines for doing the same work as the nineteen machines acquired from the Ross-Moyer Company.

The United States omits any reference to evidence showing that the nineteen machines acquired from the Ross-Moyer Company were the foundation of the United Company's General Department and enabled the United Company for the first time to put out machines for performing the work done by the Ross-Moyer machines.

The United States also omits any reference to the evidence showing that an important reason for this transaction was the desire of the United Company, in extending its service and establishing its own agencies, to do the fair thing by the Ross-Moyer Company which had formerly been agent for the United Company and its predecessor companies in Cincinnati and Chicago. Instead of taking that business away from the Ross-Moyer Company the United Company acquired that company and established its agencies in the Ross-Moyer offices.

The record also shows that an additional reason for this acquisition was to secure for the United Company the services of Mr. Ross to represent its interests in the middle West. After the acquisition Mr. Ross became the company's general agent in the West.

Edwin Theophilus Freeman (Brief for the United States, pp. 78–79).

(The facts of this transaction with references to the record are set forth in our Main Brief, Appendix I, p. 667.)

The United States obviously desires to have it understood that Freeman was engaged in the business of manufacturing and putting out nailing machines, in competition with the United Company.

The facts are that Freeman had constructed an *experimental* machine known as a "slugging machine" which "was intended to insert the slugs or ornamental fastenings which are driven around the edge of a top lift of a heel for ornamental and wear resisting purposes" (R. Vol. 1, p. 44, lines 26–29); that Freeman *had not put out any machines, had no factory and was doing no business.*

One of the United Company's machines infringed one of Freeman's patents, and there was an interference in the Patent office between applications owned by the respective parties, while, on the other hand, the Freeman machine infringed the United Company's patents.

The purpose of the acquisition was to clear up these serious patent complications and to enable the United Company to improve its machines without infringing Freeman's patents. Freeman's inventions have since been embodied in three different machines put out by the United Company.

Albert G. Brewer (Brief for the United States, p. 79).

(The facts of this transaction with references to the record are set forth in our Main Brief, Appendix I, p. 669.)

While in its statement about this transaction the United

States sets forth that Brewer's machine was only experimental, that the United Company had an experimental machine which was not commercial, and that Brewer's inventions were subsequently embodied in the United Company's machine, it omits to mention the evidence that the United Company's experimental machine was not successful until after the Brewer invention had been embodied in it and that the Brewer mechanism was much superior to that which the United Company was using before.

That no potential competition was offered by the Brewer machine is shown by the fact that Brewer's experimental machine infringed fourteen claims of a broad patent owned by the United Company.

American Sole Laying Machine Company (Brief for the United States, pp. 80–81).

(The facts of this transaction are set forth in our Main Brief, Appendix I, p. 694.)

This transaction took place after that with the Boot & Shoe Sole Laying Company, although the United States discusses it first.

The United States sets forth (pp. 80–81) that the American Company was engaged in putting out sole laying machines and that Howard testified that "the United Company was engaged in manufacturing and putting out machines for laying the soles of boots and shoes, although he claims that the United Company's machines were inferior to those of the American Sole Laying Company."

The United States evidently wishes it to be understood that the object of this transaction was to remove competition.

The United States omits any reference to the evidence that the United Company was then putting out a sole laying machine which operated upon only one shoe at a time, while the American machine was a double form machine which operated upon two shoes, rights and lefts, at the same time, and that the American Company had patent rights which prevented the United Company from making a double machine which would be twice as fast as the machine it then had.

The United States also ignores the uncontradicted evidence that the American Company's patents also prevented the United Company from adopting a satisfactory pad for its sole laying machine and further prevented necessary development of the Atlas leveling machine.

Nor does the United States explain that immediately after this acquisition the United Company combined its sole laying machine and the American machine, making a better machine than either, which operates twice as fast as its old machine.

Boot & Shoe Sole Laying Company (Brief for the United States, p. 81).

(The facts of this transaction with references to the record are set forth in our Main Brief, Appendix I, p. 662.)

This transaction preceded the American Company transaction last discussed and it took place in June, 1899, not in May, 1901, as stated by the United States.

The United States sets forth (p. 81) that the Boot & Shoe Sole Laying Company was engaged in manufacturing and putting out a sole laying machine and says that Howard testified that "the United Company was then engaged in putting out a machine for doing *similar* work, although he claims that the United's machine was inferior to the machine acquired" (italics theirs). Apparently the United States would give the impression that there was competition between the sole laying machines of these companies and that the object of this transaction was to remove that competition.

The facts are that the United Company's machine, which was of a different type, was very unsatisfactory because it was continually breaking down and because it was only adapted for large factories. It was discarded after this acquisition, and the machine of the Boot & Shoe Sole Laying Company was thereafter put out by the United Company as its standard commercial machine.

A further reason for this acquisition was that the United Company wished to use a pressing form which it had produced, but that form infringed a patent owned by the Boot & Shoe

Sole Laying Company. After the acquisition it used that form in connection with the acquired machine.

The record further shows that the business of the Boot & Shoe Sole Laying Company was very small, and that such machines as it put out were manufactured for it by others.

Accordingly it is clear that the United Company made this acquisition to obtain a machine for performing an operation for which it did not have a satisfactory machine and to enable it to use an improved mechanism without infringement,—and for no other purpose.

J. K. Krieg & Company (Brief for the United States, pp. 81–82).

(The facts of this transaction with references to the record are set forth in our Main Brief, Appendix I, p. 702.)

The United States says (p. 82) that "Howard testified that the Krieg Company was engaged in putting out a heel-seat rounding machine, a Louis heel-scarfing machine, and two or three types of embossing machines; that the United Company at that time was putting out a heel-seat rounder and a scarfing machine *of different types;* that the United Company was also engaged in putting out embossing machines" (italics ours). The United States adds that Winslow testified "that the Krieg Company had also been agent for some of the old companies that became a part of the United."

This statement by the United States is misleading in its plain implication that the principal business of the Krieg Company was putting out the three machines named and in its characterization of the United Company's machines as merely "of different types."

The facts are that J. K. Krieg & Company had been local agents for parts and supplies for the United Company's machines except the Goodyear machines, having previously been agents for the Consolidated and the McKay Companies, and their business in the two or three machines of General Department types which they had was very small and merely incidental to their business as agents for the United Company.

The important reason for this transaction was that in fol-

lowing its policy of greatly improving its service the United Company desired to establish its own agency in New York and in so doing to treat the Krieg Company fairly. This is explained in the discussion of the Ross-Moyer Company (*supra*, p. 152) and more fully in our Main Brief, Appendix I (pp. 681–682).

As to the heel seat rounder and scarfing machine "of different types," which the United States says the United Company was putting out, the heel seat rounder was merely an edge trimmer with a larger cutter, which wasted leather. The Krieg machine, specially designed for heel seat rounding, saved the pieces of leather which it removed and thus effected a considerable economy. The United Company "had no machine of that kind before" (R. Vol. 1, p. 93, lines 7–8).

The Louis heel scarfing machine of the Krieg Company and the spring-heel scarfing machine of the United Company were specially constructed for entirely different uses, and *neither could possibly be used for the work of the other* (R. Vol. 1, p. 60, lines 35–41; p. 93, lines 11–21).

The Krieg embossing machines were simple machines for ornamenting upper stock or stamping the inside of the upper of a shoe. They were of no importance, and the real effect of this transaction, as regards the merely incidental acquisition of machines, was clearly the acquiring of machines for doing work for which the United Company had no machines.

Joseph P. Curtis (Brief for the United States, pp. 82–83).

(The facts of this transaction with references to the record are set forth in our Main Brief, Appendix I, p. 704.)

The United States sets forth that by this transaction the United Company *acquired the business* of Curtis relating to cementing machines and says that Howard testified that the United Company was putting out a cementing machine, but for performing an entirely different operation.

The facts are that Curtis was *not engaged in business*, and that the United Company acquired from him nothing but certain patent rights relating to a machine for cementing a piece

of fabric to an upper. The United Company had no machine which could be used for that work, nor could the Curtis machine be used for the same work as that performed by any machine of the United Company.

The George A. Smith Machinery Company (Brief for the United States, p. 83).

(The facts of this transaction with references to the record are set forth in our Main Brief, Appendix I, p. 697.)

The United States says (p. 83) that "Howard testified that the Smith Company at the time of its acquisition was putting out a spring-heel scarfing machine, and that at the time the United Company was not putting out a machine for doing similar work. He further testified that the Smith Company had also been acting as agent prior to 1899 for certain of the companies that made up the United Company."

This statement alone shows that this transaction was perfectly normal and lawful, but even at that the statement does not give a correct picture of the transaction. The Smith Company had a store in Philadelphia; it employed one man repairing second-hand machinery; and the one machine which it put out, the Boss spring-heel scarfing machine, was manufactured for it in outside machine shops. The United Company had no machine for doing the work which that machine of the Smith Company would do.

Also Smith, like the Ross-Moyer and Krieg Companies, had formerly been agent for the United Company, and the real purpose of the transaction was to make a fair arrangement with him in connection with extending the United Company's service and establishing its own agency in Philadelphia, as is fully explained in our Main Brief, Appendix I (pp. 698–699). The acquisition of the one machine was merely incidental to that arrangement.

Arnold Machine & Supply Company (William B. Arnold) (Brief for the United States, p. 84).

(The facts of this transaction with references to the record are set forth in our Main Brief, Appendix I, p. 711.)

The United States sets forth (p. 84) that the Arnold Company was manufacturing and putting out cementing machines and says that Howard testified that "the United Company was engaged in putting out *cementing* machines, but he claimed that they were not adapted for work similar to that of the Arnold machine" (italics theirs). This statement is inadequate and is obviously intended to give a wrong impression. Mr. Howard testified that the Arnold machine was useful only for a particular kind of work, that it had to be specially constructed for that particular use and that it was not useful for any other operation, while the United Company had no machine which could possibly be used for performing the operation of the Arnold machine (R. Vol. 1, p. 64, lines 43–46; p. 65, lines 7–14).

By this transaction, accordingly, the United Company was merely entering a new field.

Booth Brothers (Brief for the United States, pp. 84–86).

(The facts of these transactions with references to the record are set forth in our Main Brief, Appendix I, pp. 713, 720.)

The United States has discussed under this heading two separate transactions which are set forth in the petition (R. Vol. 1, pp. 1015, 1016) as separate transactions.

(1) The United States says (p. 84) that in October, 1904, the United Company acquired the business of Booth Brothers relating to perforating machines. (The consideration is stated (p. 84) as $24,000 and a royalty; in fact, it was $2,400 and a royalty.)

The United States further states (p. 85) that "Howard testified that the United Company was engaged in putting out a *perforating* machine which could be used for the same operation as the Booth machines, although he claimed that it was

not *intended* for the same operation" (italics theirs). This is a distorted statement of Mr. Howard's testimony. He said that the United Company's machine was a gang machine adapted for perforating tips and that it could *not* be used to do the work done by the Booth machine, which was a single-tool, step-by-step machine, adapted and used for perforating the edges of vamps (R. Vol. 1, p. 65, lines 26–42).

It cannot be questioned that by this transaction the United Company was merely entering an entirely new field by acquiring a machine for performing an operation for which it had no machine before.

(2) The United States sets forth that in November, 1907, the United Company acquired the entire remaining business of Booth Brothers and says (pp. 85–86) that Howard testified that the United Company then acquired "a fudge edge-making machine, a *wheeling* machine, a stitch burnishing machine, an upper-shaping machine, and a *beating* machine" (italics theirs), and that "He further testified that the United Company at that time had a *wheeling* machine and an upper-*beating* [beading] machine" (italics theirs).

This statement is obviously intended to convey the impression that the United Company was competing with Booth Brothers in respect to two of the four machines acquired, namely, wheeling machine and upper beading machine. But the United States has told only a part of the story. Mr. Howard testified that the Booth wheeling machine was used on Goodyear work and that the United Company's machine was adapted only for use on McKay sewed shoes with a mock welt (R. Vol. 1, p. 84, lines 24–29). Mr. Howard further testified that the United Company's upper beading machine "was satisfactory on heavy work, but not for the light or medium work," and that the Booth Brothers machine "was a much better machine for light work" (R. Vol. 1, p. 69, lines 12–13; p. 84, lines 42–44). Mr. Howard also testified that the United Company had no machines for doing the work of the other two Booth machines (R. Vol. 1, p. 69, lines 13–14).

Accordingly by this transaction the United Company merely entered a new field by acquiring machines for performing operations for which it previously had no machines.

Fred H. Perry (Brief for the United States, p. 86).

(The facts of this transaction with references to the record are set forth in our Main Brief, Appendix I, p. 705.)

The United States sets forth (p. 86) that Perry made an agreement by which he "agreed to convey to that company all inventions which he should make relating to shoe machinery for a period of five years from the termination of his employment by the United Company."

The United States fails to explain that Perry had previously been employed by the United Company as a machinist, that at his own request he was given the opportunity to enter the inventive department of the company, and that the agreement made with him was merely an employment contract with an inventor.

That covenants to assign future inventions in contracts employing inventors are normal and legal is established by the decisions discussed on pages 497–500 of our Main Brief.

Boston Shoe Tool Company (Brief for the United States, pp. 86–87).

(The facts of this transaction with references to the record are set forth in our Main Brief, Appendix I, p. 666.)

The United States alleges (p. 86) that the United Company acquired the business of Timothy A. Bresnahan, "engaged in manufacturing and putting out machines, tools, and appliances used in the manufacture of shoes, together with the entire capital stock of the Boston Shoe Tool Company."

The failure of the United States to indicate the nature of the business in which the Boston Shoe Tool Company was engaged is significant. It was, in fact, manufacturing and selling an edge trimming machine and an edge setter, both machines of General Department type, and it was making and selling cutters for use on the edge trimming machine and edge setting irons for use on the edge setter. At this time the United Company was not manufacturing any edge cutters or any edge setting

irons, and it had no machines for doing the work of either machine acquired from the Boston Shoe Tool Company.

It is plain that by this acquisition the United Company was merely enlarging its field.

Globe Shoe Tool Company (Brief for the United States, pp. 87–88).

(The facts of this transaction with references to the record are set forth in our Main Brief, Appendix I, p. 671.)

The United States sets forth (p. 87) that the Globe Company was "engaged in manufacturing and putting out edge cutters and irons used in the manufacture of shoes."

It is true, as stated by the United States, that the Boston Shoe Tool Company, previously acquired, was also putting out "edge cutters and irons."

But the United States does not refer to other important testimony regarding this transaction. The record shows that this concern was acquired at the earnest solicitation of the partners and because the United Company desired to obtain the services of one of the partners, Mr. Loomer, as the head of its department for manufacturing such tools. Plaintiff's Exhibit 72 (R. Vol. 3, p. 581) recites that employment by Loomer had been agreed upon "as an inducement to the United Company to take over said business and to purchase the property and assets of said partnership."

Also, the Globe Company was infringing two of the United Company's patents.

It is further important to note that after this acquisition very large reductions were made by the United Company in the prices of tools such as the Globe Company was making. Details are stated on pages 671–672 of our Main Brief, Appendix I.

In respect to the covenants in the agreements with Loomer and Perkins which the United States sets forth, it is important to note that *both* Loomer and Perkins entered the United Company's employ, and that *no covenants* were taken from the other three partners, who did not enter the employ of the United Company (P.'s Ex. 71, R. Vol. 3, p. 577).

John Ritchie, and John Ritchie Company (Brief for the United States, pp. 88–89).

(The facts of this transaction with references to the record are set forth in our Main Brief, Appendix I, p. 672.)

The United States alleges (p. 88) that the United Company acquired "all the *business* of John Ritchie, and John Ritchie Company, a corporation, *relating to the manufacture* of standard screw machines, slugging machines, tacking machines," etc. (italics ours).

It is obviously the intention of the United States to give the impression that John Ritchie and John Ritchie Company were engaged in the *manufacture* of metallic fastening machines. That is not the fact.

The facts shown by the record are: The Ritchie Company was not engaged in *manufacturing machines* but was engaged in the manufacture of *boots and shoes.* It had one machine for the manufacture of *wire.* The metallic fastening machines which are referred to in the agreement relating to this transaction were being *used* by the Ritchie Company, and they were immediately leased back to them by the United Company (R. Vol. 1, p. 46, lines 15–30; P.'s Ex. 74, Vol. 3, pp. 586, 587, 589, 590; Defs.' Ex. 231, Vol. 5, p. 475).

Again, the United States alleges (pp. 88–89) that "The purpose of defendants to force shoe manufacturers to deal exclusively with the United Company" is well illustrated by Mr. Winslow in Defendants' Exhibit 231 (R. Vol. 5, p. 475) where it states that the reason for this transaction "was to prevent manufacturers who held Metallic Machinery under lease from the United Company (and who had agreed to purchase their metallic fastening material from the United Company), violating their leases and contracts by purchasing material from Ritchie."

The United States does not refer to the evidence that the John Ritchie Company had one machine for making standard screw wire and that they were selling wire to lessees of the United Company's metallic machines who had agreed

to buy fastening material from the United Company in payment of royalty for the use of the machines; that in such cases of course the United Company got no return for the use of its machine; and that the purpose of the transaction was to remove that dishonest situation.

It should further be noted that the United States has not raised any question in this suit as to the propriety or legality of the provisions of the metallic leases providing for payment for use of the machines through purchase of fastening material.

Stanley Manufacturing Company (Brief for the United States, pp. 89–90).

(The facts of this transaction with references to the record are set forth in our Main Brief, Appendix I, p. 676.)

On the face of the statement by the United States (p. 89), the United Company simply acquired certain machines, parts and supplies which the Stanley Company, engaged in business at Lawrence, Massachusetts, had on hand at Frankfurt, Germany.

The United States omits any reference to testimony showing that the United Company had no machines for doing the work of any one of the miscellaneous General Department machines which the Stanley Company was putting out and that the agreement amounted simply to an agency contract.

The United States quotes at length the covenant made by the Stanley Company not to compete in foreign countries, but it omits to refer to the covenants in the same agreement (P.'s Ex. 78, R. Vol. 3, pp. 621–622) which provided:—

(1) "that the said United Company shall use its best endeavors to sell in foreign countries, machines made by the said Stanley Company . . .;"

(2) that in case the United Company should discontinue the purchase from the Stanley Company and sale

> "of any of the machines, parts or supplies made by the said Stanley Company . . . the said Stanley Company may then and thereafter sell such machines, parts or

supplies thus discontinued to any and all persons without respect to the country to which they are to be sent;"

and

(3) "That the said Stanley Company may advertise and create and maintain in all proper business ways a demand for its machines in any and all countries in the world."

The United States (p. 90) characterizes as "A somewhat similar transaction" the agreement with W. J. Young. This transaction was similar only in the respect that it related solely to business in foreign countries. The facts of the Young transaction are set forth in full on pages 696–697 of our Main Brief, Appendix I.

Bay State International Shoe Machinery Company (Brief for the United States, p. 90).

(The facts of this transaction with references to the record are set forth in our Main Brief, Appendix I, p. 683.)

The United States sets forth (p. 90) that the United Company acquired for its French and German companies "the property and good will for the Continent of Europe of the Bay State International Shoe Machinery Company" for $25,000 in preferred stock of the United Company. It further states that Howard testified that the Bay State Company "'had a welter and stitcher and I think *a rough rounder*' but that he did not know whether it 'was shipping machinery from the United States to foreign countries'" (italics theirs).

The United States omits to state that after further investigation Mr. Howard testified that the machines of the Bay State Company were manufactured in Montreal, Canada; none whatever in this country. Other important facts shown by the record, which the United States does not mention, are that the machines of the Bay State Company were very different in construction from and distinctly inferior to the United Company's machines; that it had done business only in England and had put out only ten sets of its machines in England; that its machines infringed the United Company's

English patents; and that the purchase was made at the earnest solicitation of the people interested in the company, who were also customers of the United Company, as the cheapest way to dispose of the litigation.

George W. Emerson & Company (Brief for the United States, pp. 90–91).

(The facts of this transaction with references to the record are set forth in our Main Brief, Appendix I, p. 699.)

The United States says (p. 91) that Howard testified that the United Company acquired from the Emerson Company a power spring-heel scarfer and a heel burnishing machine and that at that time the United Company was "putting out a heel-burnishing machine but of a different type from that put out by the Emerson Company, and that the United Company was also putting out a spring-heel scarfing machine to be operated by hand."

The United States omits to make any reference to the following important facts:—

The principal business of the Emerson Company was manufacturing and supplying lasts and forms to be used for sole leveling machines of the "Giant" type, and the United Company was developing a leveling machine on which lasts and forms were used.

The Emerson Company had a tip scourer used in repairing the tips of patent leather shoes. The United Company had no tip scourer (R. Vol. 1, p. 58, lines 24–25; p. 95, lines 1–3).

The Emerson heel burnishing machine was of a different type and performed its operation in an entirely different way from the United Company's machine. Some manufacturers insisted upon one type of machine and others upon the other type. The Emerson Company's machine infringed numerous important claims in two patents controlled by the United Company.

An important object of the transaction was to obtain the services of William R. Sampson, the active man in the Emerson concern.

Another object was to settle the pending litigation.

Joseph W. Leary (Brief for the United States, pp. 91–92).

(The facts of this transaction with references to the record are set forth in our Main Brief, Appendix I, p. 705.)

The United States sets forth (p. 91) that the United Company acquired from Joseph W. Leary, of Lynn, Massachusetts, "his business of manufacturing and dealing in shoe machinery."

This statement is very misleading. Leary was doing *no manufacturing of any kind.* He employed no men and had no factory. He was principally engaged in retailing cements and blackings, and he also dealt in a very small way in second-hand sewing machines for sewing together the parts of shoe uppers.

Leary was also local agent for the United Company's Amazeen skiving machine. He was extremely capable and successful as salesman, and the United Company desired to obtain his services in a wider field. He stated that he would enter its employ if the company would buy his stock of cement and second-hand machinery, and he was paid $3,052 for the small stock that he had.

The United States alleges (p. 92) that Leary "agreed to convey to the United Company all improvements which he should make within 10 years from the date of the termination of his employment with the United Company."

In fact, Leary made no covenant whatever to assign any future improvements. On the contrary, the Leary agreement (P.'s Ex. 108, R. Vol. 4, p. 768) specifically provided that Leary should "not be required to disclose his secret formulæ for making cements, blackings or stains."

Zachary Taylor French (Brief for the United States, pp. 92–93).

(The facts of this transaction with references to the record are set forth in our Main Brief, Appendix I, p. 709.)

The United States alleges (p. 92) that the United Company "acquired the business of Zachary Taylor French, Boston, Mass., engaged in the development of machines designed and used in the manufacture of boots and shoes."

The testimony to which the United States then refers shows that the United Company did not acquire any "*business*" from French and that French was not engaged in business, but that the transaction was merely an agreement commuting obligations to pay royalties which would become due under various existing contracts.

The United States omits to explain that these contracts had all been made with the Goodyear Company prior to 1899 and that the agreement was made because French desired to have his royalty contracts placed upon a definite basis of annual payment.

Kimball & Hadley (Brief for the United States, pp. 93–95).

(The facts of this transaction with references to the record are set forth in our Main Brief, Appendix I, p. 710.)

The United States sets forth that Kimball & Hadley were "engaged in manufacturing and marketing *awls, needles*, drivers, supplies, etc." (italics theirs) and states (p. 93) that Howard testified that "the United Company was engaged in manufacturing and putting out *awls and needles*, except curved needles for the Goodyear sewing machine, and that the United Company was making awls for the use of its own machines" (italics theirs).

This statement by the United States is inaccurate and misleading. Howard did not testify that the United Company was putting out needles. He explained that the awls that it was making were for its metallic machines and were "straight awls, which make a straight hole for a nail, and bear no resemblance to the curved awl used in a welter or stitcher" (R. Vol. 1, p. 64, lines 18–20).

The United States further alleges that Kimball & Hadley were forced to sell out by reason of the United Company's leasing system and that its lessees were obliged by the terms of their leases to take needles from the United Company. Neither of these statements is supported by the record.

(1) In the suit brought by the United Company to enforce the covenants made by Kimball & Hadley not to engage in similar business within fifteen years the Supreme Court of

Massachusetts approved the finding of the lower court "that they made the sale voluntarily" (*United Shoe Machinery Co.* v. *Kimball et al.*, 193 Mass. 351, 354, 357).

(2) Lessees of the United Company's Goodyear machines are *not* required by the terms of their leases to take the needles from the United Company. Needles are not machine parts. Representatives of several manufacturers testified that they bought awls and needles wherever they wished and that they had bought them from Kimball & Hadley (Roberts, R. Vol. 1, p. 747, lines 10–21; Hogan, p. 747, lines 35–36; Tierney, p. 760, lines 22–24; Bryant, p. 761, lines 4–6). Both Roberts and Hogan stated the reasons why they stopped buying from Kimball & Hadley and both specifically said that it was not on account of the United Company's leases. Roberts testified: "The United Company has never required us to buy needles and awls from any particular source" (R. Vol. 1, p. 747, lines 11–17; 42–43).

Hadley's testimony as to statements made to him by shoe manufacturers that they could not buy his needles because if they did the United Company would take out its machines was specifically denied by all the manufacturers or employees in the factories which Hadley named who had anything to do with buying needles, as is fully set forth in our Main Brief, Appendix I, pp. 767–769.

In its statement (p. 95) that Kimball & Hadley again engaged in the awl and needle business and that "the United Company brought suit to enjoin them, upon the ground that they were violating their agreement of June 11, 1904," the United States neglects to state that the Supreme Court of Massachusetts held that the covenant was reasonable and valid and approved the granting of an injunction enforcing it (*United Shoe Machinery Co.* v. *Kimball et al.*, supra).

Leopold J. Courteau (Brief for the United States, pp. 95–96).

(The facts of this transaction with references to the record are set forth in our Main Brief, Appendix I, p. 712.)

On the face of it the statement by the United States (p. 95) that the United Company acquired from Courteau "all his

inventions and devices, including letters patent, relating to machines and mechanisms for holding the linings of shoes during the process of pasting the outer leather to the lining" shows that this transaction is of no importance in this suit.

It should, however, be pointed out, first, that the statement is erroneous in saying that the United Company acquired "devices." The United Company did not acquire any devices; it acquired merely an invention. Second, the United States omits to refer to the testimony showing that the United Company had no machine for performing this operation.

Brockton Supply Company (Brief for the United States, p. 96).

(The facts of this transaction with references to the record are set forth in our Main Brief, Appendix I, p. 714.)

In its statement regarding the tack pulling machine which was acquired from this concern the United States says (p. 96) that "Howard testified that at the time of acquiring the business of the Brockton Supply Company the United Company was engaged in developing a machine for pulling lasting tacks, but that none had been put out."

The United States omits to refer to testimony showing that the United Company's experimental machine infringed a patent of the Brockton Supply Company and that the Brockton Company's machine infringed the United Company's patent applications.

Zotique Beaudry (Brief for the United States, pp. 96–97).

(The facts of this transaction with references to the record are set forth in our Main Brief, Appendix I, p. 719.)

The United States sets forth (pp. 96–97) that the United Company acquired from Beaudry his inventions and improvements relating to machines for burnishing and finishing the heels of shoes and that Howard testified that at this time "the United Company *had* a heel burnishing machine" (italics theirs).

The United States omits to refer to testimony showing that Beaudry's business was not acquired and that all the United Company did acquire was his experimental heel burnishing machine and the patents on that machine; that the acquisition was made because it was believed that the Beaudry inventions, which embodied an entirely new idea, would greatly improve the United Company's machines; and that Beaudry's machine infringed many claims of one of the United Company's patents.

The statement by the United States (p. 96) that Beaudry made a covenant "that all inventions which he should thereafter make should be disclosed" is not supported by the record. That covenant was specifically limited to "heel finishing machinery, methods or devices," the subject-matter of the transaction (P.'s Ex. 120, R. Vol. 4, pp. 850, 853, 854).

Richardson Shoe Machinery Company (Brief for the United States, pp. 97–98).

(The facts of this transaction with references to the record are set forth in our Main Brief, Appendix I, p. 722.)

The United States sets forth that the Richardson Company was manufacturing and putting out McKay sewing machines and clicking machines and it says that Howard testified that the United Company was then manufacturing and putting out McKay sewing machines.

The United States omits to refer to testimony showing that a very important feature of the United Company's McKay sewing machine infringed one of the Richardson Company's patents; that the Richardson machine was a great deal better than the United Company's; that it was believed, and it eventually proved, that a better machine than either could be constructed by using inventions owned by both companies; that improvements broadly claimed in two Richardson patents are embodied in the United Company's new Model M outsole stitcher; and that the improvement of one of those patents is embodied in the United Company's new Model K welter.

The record shows that the Richardson Company was not manufacturing and putting out clicking machines as alleged by the United States (see our Main Brief, Appendix I, pp. 724–725).

Harry L. Rice and Fred LaChapelle (Brief for the United States, pp. 98–99).

(The facts of this transaction with references to the record are set forth in our Main Brief, Appendix I, p. 728.)

The United States omits to refer to any testimony showing that the Rice and LaChapelle welting machine, embodying the patented inventions which were acquired, was only experimental and far from being commercial, and that it was believed that these improvements would not only strengthen the inseam of a welt shoe, but would effect substantial economies.

In the statement by the United States of the covenant not to compete, which was made by Rice and LaChapelle, the United States omits to state that the covenant was limited to a period of ten years.

The Wentworth Company (Brief for the United States, pp. 99–100).

(The facts of this transaction with references to the record are set forth in our Main Brief, Appendix I, p. 730.)

The United States sets forth that by this transaction the United Company acquired a machine for beating heel seats and a shank sticking machine. It says (p. 100) that Howard testified "that the United Company at that time was manufacturing a machine for beating heel seats, and that the United was experimenting with the shank sticking machine."

The United States omits to refer to testimony showing that the United Company's machine for beating heel seats was similar to the Wentworth machine only in name, that the two machines operated in entirely different ways; that the United Company's machine was discarded after this acquisition; that

the patent on the Wentworth shank sticking machine prevented the United Company from developing a machine; and that the Wentworth shank sticking machine infringed one of the United Company's patents.

That the Wentworth heel seat beating machine could not possibly offer any competition is shown by the fact that it infringed many claims of two of the United Company's patents; that suits had been brought and those claims had been held to be valid and infringed; and that they covered indispensable features of the Wentworth machine so that the Wentworth Company could no longer put out the machine.

Adam H. Prenzel (Brief for the United States, pp. 100–101).

(The facts of this transaction with references to the record are set forth in our Main Brief, Appendix I, p. 733.)

The United States sets forth (p. 100) that the United Company acquired from Prenzel his inventions and patents "relating to certain machines used in the manufacture of turn shoes."

Important facts to which the United States fails to refer are that Prenzel, who was a shoe manufacturer, had made valuable patented inventions relating to a new type of spring heel shoe and a new type of infants' shoe and special machines for making them and that the United Company had no such machines; that accordingly the United Company was by this transaction entering a new field; and also that this acquisition enabled the United Company to use three of the Prenzel patents in one of its important machines.

M. V. Bresnahan & Company (Brief for the United States, pp. 101–102).

(The facts of this transaction with references to the record are set forth in our Main Brief, Appendix I, p. 734.)

The United States says that the testimony shows that by this purchase the United Company acquired an experimental lasting machine and a heel burnishing machine and

that the United Company was then putting out lasting machines and heel burnishing machines.

The United States does not refer to testimony showing that the United Company's machines would not accomplish the same results as the Bresnahan machines because they did not have the Bresnahan patented inventions, and that there was a great amount of pending litigation, largely infringement suits, between Bresnahan and the United Company in some of which Bresnahan was defendant and in others the United Company. The agreement for purchase specifically discharged the United Company from all claims and demands covered by the suits which had been brought against it (P.'s Ex. 144, R. Vol. 4, p. 1058).

With reference to the statement by the United States (p. 102) that the schedule attached to the agreement "gives a list of many different machines together with supplies acquired from the Bresnahan Company," it should be noted that the machines are nearly all machine-shop machines and that the few shoe machines named, one or two of a kind, are obviously second-hand machines such as dealers in shoe machinery usually have on hand.

Charles P. Stanbon & Company (Brief for the United States p. 102).

(The facts of this transaction with references to the record are set forth in our Main Brief, Appendix I, p. 736.)

The United States says (p. 102) that Howard testified that the United Company acquired from Stanbon "a channel-cementing machine, a folding machine, perforating machine, and a channel-opening machine, and that the United Company at that time *was* putting out an inferior channel-cementing machine and a perforating machine" (italics theirs).

The United States omits to refer to testimony showing that the United Company's channel cementing machine was inferior *because* the United Company had been obliged to take off improvements which infringed Stanbon's patents; that the United Company's perforating machine and the

Stanbon machine are used in distinct and different fields, and that the Stanbon machine would do work which the United Company's machine could not do; that there were pending interferences in the Patent Office involving applications owned by the two parties in which the issues were so broad that the party winning the interference would be able to prevent the other party from putting out any machine of the kind; and that by this transaction the United Company was enabled for the first time to put out a folding machine.

APPENDIX II.

THE CHART ANNEXED TO THE BRIEF FOR THE UNITED STATES AS "APPENDIX A" IS GROSSLY MISLEADING AND GROSSLY DISTORTS THE FACTS.

There is attached to the brief for the United States an Appendix "A" which the brief writer has headed "Chart Illustrative of the Practical Effect of Exclusive Use and Tying Provisions in Restrictive Lease and License Agreements for the use of Shoe Machinery Owned and Controlled by Defendants." In this chart the brief writer by an arrangement of groups of machines and by a labyrinth of connecting lines has endeavored to draw a picture showing the utmost of confusion. There is no justification for the chart or for the picture which it purports to draw, and its presence in the brief can be accounted for only as an effort to create upon the mind of the brief reader who examines the chart, a false impression of the inter-relation of the various groups of machines and of the extent and effect of the clauses contained in various of the leases.

A similar chart was attached as "Exhibit 23" to the original petition filed in this case, but was abandoned by counsel for the United States, who agreed that it should be disregarded when the defendants at the trial offered a witness to point out its misleading character and its misstatements and inaccuracies. Yet the brief writer has the temerity to say (Brief for the United States, pp 179–180):—

> "A chart illustrative of the practical effect of the tying clauses in these restrictive leases is submitted herewith as Appendix A. This chart has been criticised by the defendants, but all the criticisms are trivial and none of them is based upon fact."

Only the persistence of counsel for the United States in the employment of such a means and the fact that to one not familiar with shoe manufacturing a graphic of this character might not be understood and might be taken to in some degree represent the facts require any discussion of this chart in this reply brief. We shall not take the time of the Court to discuss in detail the many misstatements and inaccuracies, but shall simply point out some respects in which it is fundamentally misleading.

1. The very heading of the chart is an affront to the intelligence of one at all conversant with the actual situation. The heading uses the phrase "Practical Effect," and purports to set forth a practical condition, yet it entirely omits to indicate the fundamental fact that entirely different machines and groupings of machines are used in the manufacture of each of the various kinds of shoes. On the contrary, it runs together in the same table machines used in the manufacture of McKay sewed shoes, welt shoes, turn shoes, pegged shoes, standard screw shoes, nailed shoes and shoes of other kinds. It is obvious that such a confusion of machinery has enabled the chart draftsman to picture a multiplicity of connecting lines which have the effect and can have been intended only to have the effect of picturing a condition which is anything but "practical." It is obvious that if a graphic of this sort were to be undertaken the only fair method would have been to set forth the machines and groups of machines used for each class of shoes separately, but this obviously would not have resulted in the desired picture of confusion and was not adopted.

2. Even upon the chart as it has been prepared arrangement of the groups of machinery has obviously been made by the draftsman not with an idea to any consecutive or logical order but with a view to creating a maximum of confusion; *i.e.*, the chart begins (Table 1) with pulling-over machines, jumps (Table 2) to heeling machines, goes back (Table 3) to eyeletting machines, then to General Department machines (Table 4). From General Department machines it goes to pegging machines—the sole-attaching machines for pegged shoes (Table 5), then back to the lasting

machines (Table 6), then to metallic machines (Table 7), and finally (Table 8) to the Goodyear Department machines. The sole-attaching machines for McKay shoes are set forth in Table 4, the sole-attaching machines for pegged shoes in Table 5, the sole-attaching machines for standard screw and loose nailed shoes in Table 7, and the sole-attaching machines for Goodyear welt and Goodyear turn shoes in Table 8.

3. By the arrangement and grouping of machines adopted by the draftsman he has undertaken to justify himself in showing connecting lines between various of his groups which, to a casual observer who did not study the chart in detail or who was not familiar with the actual conditions, might leave the impression that a tie existed generally between the machines of the groups so purporting to be connected. For illustration, connection is shown from various of the tables, *e.g.*, Tables 1, 2, 3, and 4 to Table 8 (Goodyear machines). Among the machines referred to in Table 8 are the various auxiliary machines of the Goodyear Department to which there is no tie under any form of lease from any machine of any department. A connection is shown from Table 6 (lasting machines) to Table 2 (heeling machines), whereas of all the machines set forth in Table 6 only two unimportant machines, namely, an obsolete type of lasting machine and a machine which is not a lasting machine at all, but a tacking device, have ever been put out upon any form of lease which in any way restricted their use to any of the machines of the Heeling Department. A connection is shown from Table 4 (General Department) to Tables 5, 6, 7, and 8. Among the machines included in Table 4 is a McKay sewing machine which has never been put out by the defendants upon any form of lease which restricted the use of the machine in any way to any of the machines of Tables 5, 7, or 8. Illustrations might be multiplied.

4. By the arrangement and grouping of machines and the enumerations contained in the chart, the draftsman has undertaken to magnify the tying in a way that is anything but "practical," by enumerating (without note) in various of the tables various machines for performing the same or similar operation only one of which would be used in any

one particular case on any one particular type of shoe, and in showing in the same table different forms of lease. For example, in Table 6 there is the enumeration of several different types of lasting machine; in Table 2 the list includes several forms of heel attaching machines and several forms of heel trimmers; in Table 3 there are two kinds of eyeletting machines listed; in Table 4 there are different forms of lease for the same machines of the General Department; in Table 7 there are enumerated several types or models of machines for performing the same character of work; for example, a double head taper nail tacker and a single head taper nail tacker, a rapid standard screw machine and an old style standard screw machine; in Table 8 there are different forms of lease for the same Goodyear machines. The arrows in the chart would appear to indicate, without careful study and analysis, that all the machines in one group are tied to all of the machines in another group, whereas the tie would actually exist, as a "practical" matter, if it existed at all, only between certain selected machines of one group and certain selected machines of the other group.

5. The chart upon its face purports to cover only what counsel for the United States are pleased to call the restricted forms of lease. It therefore admittedly undertakes to set forth only a part of the whole story, and this part it sets forth in a manner bound to confuse and mislead.

6. The chart at one or more points in each of the tables with the exception of Table 3 contains a statement to the effect that the lessee "must use exclusively" the lessor's machines of certain kinds or for certain work. This statement is absolutely without justification in any instance.

There is not a table contained in the chart concerning which specific criticism might not be made if it were necessary. We believe, however, in the above general comment we have indicated to the Court that the chart is grossly misleading and utterly unworthy of acceptance for any purpose. It is difficult to conceive how the brief writer could have justified himself in placing such a graphic before this Court.

APPENDIX III.

COMMENT UPON APPENDICES C, D, AND E ANNEXED TO THE BRIEF FOR THE UNITED STATES.

The brief for the United States says at page 172:—

> "Appendix C is a brief statement of the clauses contained in each lease of the defendants. It has been carefully compared with the record and is believed to be entirely accurate. Appendix D shows, as to each of the various clauses set out, the leases in which it is to be found. Appendix E is a tabular statement of the same material."

The writer of the brief for the United States has not refrained, even in these purported tabular statements, from misleading arrangement and statement and from the same dexterous use of ambiguities and half-truths which he has employed throughout the other portion of the brief. There are many inaccuracies and misstatements of fact (some of which were noted in our brief upon prior hearing in reply to the prior brief for the United States), but for the present purposes it will be sufficient to point out a few striking instances only in which, by order of arrangement, by misstatement of facts, and by omission to state necessary qualifying and explanatory facts, a misleading picture is presented.

For example, as to the very first machine, the leases of which are discussed in Appendix C, viz., the leases for Consolidated hand method lasting machines, the brief writer fails to make clear the important fact that there are two distinct types of this machine,—the one adapted for lasting McKay sewed and metallic fastened shoes, and the other adapted for lasting welt shoes.

The first exhibit discussed (Exhibit 16) is a form of lease without initial payment for the McKay lasting machine, and

is not designed or adapted, as the evidence clearly showed, to use upon welted or turned footwear. The brief writer, however, carefully ignoring this fact, states the prohibitive clause in this lease, without explanation or qualification, as "applying to welting, stitching" and "turn sewing" machines; that is, to machines used in kinds of footwear to which, as the record clearly shows, the lasting machine covered by this lease has no application. He makes no note of this fact, although in his discussion which follows of Exhibit 15 he notes that there the prohibitive clause does not "extend to metallic fastening machines" and explains (the omission from his point of view apparently requiring explanation) that "this form of lease is used for the hand method type of machine when adapted to lasting welt shoes."

Again, at page 355 of Appendix C, in discussing a lease for auxiliary machines of the Goodyear Department, the brief writer states,—

> "*Exclusive Use* clause applying to welting, turn sewing and outsole stitching machines," (italics theirs).

Without explanation a reader might take this to be a statement that there was some requirement of exclusive use—which is not the fact—or that there was some provision requiring use or exclusive use of these auxiliary machines, whereas, as a matter of fact, there is no requirement, under any form of lease, that any of these auxiliary machines shall be used exclusively or shall be used at all or any limitation of any machines to use with them.

Also under the same heading the brief writer states,—

"*Annual Rental*, amounting to about $184 per annum," (italics theirs).

It is to be noted that the lease there under discussion (Exhibit 25) contains a schedule of machines setting forth some twenty-four different kinds of machines which may be taken under that form of lease. Opposite each machine is set forth an amount to be paid as annual rental for such machine, these amounts running all the way from one dollar per year up to (in one instance) thirty-five dollars per year.

In the case of fifteen machines this annual rental is five dollars or less per year, and in the case of only two machines does it exceed fifteen dollars per year. A lessee under this form of lease might have one machine only or might have several machines. In no case would he have all such machines. Some machines are adapted for one kind of work, some for another. There are auxiliary machines for use in welt work and others for use in turn work. The rental under any given lease upon this form would depend upon the particular machine or machines covered thereby, yet the brief writer has added together the annual rentals set forth in respect to all of these twenty-four machines and has made the statement:—"*Annual rental*, amounting to about $184 per annum," (italics theirs) which amount would be the aggregate annual rental only in a case (which would never exist) of a lessee taking upon one lease of this form one machine of each and every of all these twenty-four kinds.

Perhaps the most flagrant instance of misstatement in these summaries is that contained at page 356 where the brief writer baldly states, "In order to obtain either the welt sewing or the stitching or any of the auxiliary machines, the lessee must agree that he will not use at any time in his factory any welt sewing or outsole stitching machine made by any competitor of the defendants." This is such an absolute misstatement of the fact and is so obviously without foundation or justification that it is not necessary even to discuss it here.

Another instance of the utmost perversion of the facts is in what the brief writer has stated in this portion of his brief with reference to the leases for pulling-over machinery, with the extraordinary conclusion, based upon a series of preceding misstatements (Brief for the United States, p. 362) that

> "The net result is for lasting and pulling over under Exhibit 39, the so-called independent lease, the lessee has to pay ½c. a pair, while under Exhibit 38 he pays only ⅜c. a pair."

By what possible process of misstatement or misunderstanding the brief writer could have reached the conclusion

that under any form of lease the royalty "*for lasting and pulling-over*" (italics ours) is either ½ cent a pair or ⅜ cent a pair is beyond comprehension in view of the facts that the royalty for the lasting operation alone as set forth in the lasting machine leases themselves which the brief writer had just been examining is in itself one-half cent or more; that Exhibit 39 makes no reference to lasting machine royalty, but provides its own royalty for the use of pulling-over machines; and that Exhibit 38 simply provides a royalty for the machines of the pulling-over system with a proviso (and this proviso has no reference whatever to lasting machine royalty) that under certain conditions the royalty *for the pulling-over machines and auxiliaries* shall not exceed a maximum of ⅜ cent per pair (net) measured by the total number of shoes lasted (*i.e.*, the total made) in the factory.

In the Appendix C attached to the previous brief herein addressed to this Court filed by the United States upon the original argument this same statement was made, with the exception that the contrast was made greater by the statement of 1 cent a pair with respect to Exhibit 39 in place of ½ cent as here. The falsity of the entire discussion was pointed out, with the result that the brief writer has cut his statement of royalty under Exhibit 39 in two (now ½ cent), but has otherwise permitted it to stand.

The simple fact is that the United Company, after bringing out its pulling-over system of machines and finding that there was a tendency on the part of some manufacturers of shoes to use the machine for a small part of their work only or for work of a particular kind only, endeavored to make it an object for such manufacturers to use the pulling-over machines upon a greater portion of their work by providing a reduction of ⅛ cent (from ½ to ⅜) in case the manufacturer should use the machines upon such a proportion of his work that it would be cheaper for him to pay ⅜ cent measured by his factory output (*i.e.*, measured by all shoes lasted in his factory) than to pay ½ cent in respect only to a limited number of shoes operated upon by the machines. Under both forms of lease the royalty is independent of and in addition to any royalty for lasting machines. The varia-

tion in the royalty and in the method of computation was simply a business inducement to encourage a more extended use of the pulling-over machines.

Not to detail the many other inaccuracies and misstatements of these summaries it is perhaps sufficient to point out that in general the summaries fail to distinguish between old forms and current forms of leases and between current and obsolete forms of machines; that they make persistent misstatement with reference to the various clauses, including what they call the "exclusive use clause," the "prohibitive clause," and the "additional machinery clause." For example, in Appendix E (pages 375–376) an "additional machinery clause" is noted as appearing in ten different leases, of which one is a heeling machine lease, two pulling-over leases, and seven metallic leases. It is not noted that various of these leases are of obsolete form, and that in the case of others the clause is not in the form of an undertaking by the lessee to take additional machinery from the lessor, but merely a reservation to the lessor of a right to terminate its own leases of certain kinds of machines. The evidence clearly shows that the additional machinery clause was never adopted by the United Company for any general use, and that it was discontinued long before the bringing of this suit.

Other points purporting to be dealt with in these summaries have already been discussed in our own brief. Sufficient here, we think, has been shown to demonstrate that the several appendices attached to the brief for the United States are thoroughly unreliable, are unsafe to be used as guides for any material purpose, and that a true understanding of the actual facts can be obtained only by reference to the leases themselves and to the evidence concerning them.

APPENDIX IV.

VARIOUS COMBINATIONS IN WHICH MACHINES OF THE UNITED COMPANY AND MACHINES OF COMPETITORS MAY BE TAKEN AND USED FOR PERFORMING THE OPERATIONS OF LASTING, SOLE-ATTACHING, METALLIC FASTENING AND HEELING IN THE MANUFACTURE OF VARIOUS KINDS OF SHOES—SHOWING IN THE CASE OF THE UNITED COMPANY'S MACHINES THE FORMS OF LEASES WHICH THE LESSEE AT HIS OPTION MAY CHOOSE FOR SUCH OF THE UNITED COMPANY'S MACHINES AS ARE INCLUDED IN EACH OF THE SEVERAL COMBINATIONS.

A. The letter "*A*" opposite the designation of the United Company's machines in the following combinations denotes that form of lease used by the United Company by which it furnished its machines for use in groups without requiring the payment of any initial license fee upon the installation of the machines, but with the use of the machines (excepting Goodyear machines) leased under this form of lease limited to use with certain other machines of the United Company of other departments for performing certain other specified operations.

The Goodyear principal machines are not, under any form of lease, limited to use with Goodyear auxiliary machines or with any other machines of any other department. No machines of any other department are under any form of lease limited to use with the United Company's Goodyear auxiliary machines, and Goodyear auxiliary machines are not, under any form of lease, limited to use with the United Company's machines of any other department.

B. The letter "*B*" opposite the designation of the United Company's machines in the following combinations denotes that form of lease used by the United Company under which an initial license fee is paid by the lessee upon the installation of each machine, but the use of the machines leased is not limited to use with any other machines of the United Company in any other department.

C. The letter "*C*" opposite the designation of the United Company's machines in the following combinations denotes that form of lease used by the United Company for machines of its Metallic Department under which the use of the machines leased is not limited to use with any other machines of the United Company in any other department, nor is any initial license fee required to be paid, but in lieu thereof there is provision that the lessor may charge 10 per cent. more for fastening material supplied for use in the metallic machines held under this form of lease than is charged for use of the metallic machines when held as part of a group of machines under the limited form of lease.

NOTE 1. A large part of the turn shoes made are lasted by hand.

NOTE 2. In each of the foregoing combinations in which the United Company's welter and stitcher are used in the manufacture of welted footwear, or in which the United Company's turn sewing machine is used in the manufacture of turned footwear, regardless of the form of lease, the lessee may use the United Company's Goodyear auxiliary machines on either form of auxiliary machine lease or may use auxiliary machines obtained from others, or may use some such auxiliaries obtained from the United Company and some obtained from others in any combination he may see fit.

NOTE 3. The machines covered by the above combinations are the machines which the petition filed in this case defines as the "principal essential machines used in the manufacture of boots or shoes" (Petition, R. Vol. 1, p. 991), namely, "lasting machines," "welt sewing machines and outsole

stitching machines," "heeling machines," and "metallic fastening machines" (R. Vol. 1, p. 991). In addition, the combinations deal with the McKay sewing machine.

The foregoing combinations are illuminating in connection with the charge of the petition (R. Vol. 1, p. 994) that the defendants

> "conceived the idea of acquiring the ownership or control of all concerns engaged in manufacturing and dealing in any and all kinds of shoe machinery, and then to refuse to sell or lease any of the *essential machines* to the manufacture of shoes except on condition that he buy or lease of them practically all other machinery or whatever kind necessary or useful to such manufacturer of shoes . . ." (italics ours.

NOTE 4. The foregoing combinations show clearly the fallacy of the contention on behalf of the United States that a manufacturer in order to obtain machines of one or more kinds from the United Company would be under the necessity, as a "practical" matter or in any other manner, either of taking all other machines from the United Company or, under any combination, of taking all his machines upon the initial license fee or upon an unrestricted form of lease. Obviously he is under no such necessity as to machines which he does not take from the United Company and, as clearly shown by the above, the necessity does not exist even as to the United Company's machines excepting in a very limited way and as to a limited number of machines differing according to the different combinations in which the machines are to be used.

Of the 62 combinations of machines above set forth, there are 22 combinations in which the lessee either takes none of the United Company's lasting, welt sewing and outsole stitching, heeling or metallic fastening machines under lease, or may take all of such machines taken thereunder under lease from the United Company, upon either the restricted or the unrestricted or non-initial payment forms of lease, as he may elect. He is under no necessity, in order to use the machines in the combinations indicated, to take them or any of them under the unrestricted or initial payment forms. There are 23 other combinations out of the 62 in which, of the machines of the United Company taken under lease thereunder, one

class only need be taken if the lessee desires to use them in the combinations indicated, upon the unrestricted or initial payment form of lease. There are fifteen combinations in which two of the classes are to be leased, if the lessee desires to lease them from the United Company for use in such combinations, upon the unrestricted or initial payment form, and there are only two of the combinations in which this applies to more than two of the classes.

IN THE

Supreme Court of the United States

OCTOBER TERM, 1917.

No. 207.

UNITED STATES OF AMERICA, *Appellant,*

vs.

UNITED SHOE MACHINERY COMPANY, OF NEW JERSEY, *et al., Appellees.*

MEMORANDUM SUBMITTED BY APPELLEES.

The Defendants respectfully submit the following memorandum in further reply to the brief of the United States. The matters herein referred to were not incorporated in our briefs previously filed, because we did not receive a copy of the brief for the United States until December 22d; we then received but one copy and did not receive additional copies until December 26th, so that the time for an examination of and reply to the brief was extremely lim-

ited and shorter than the period contemplated by the Rules.

In this memorandum we desire to point out that the issues raised by the assignment of errors, the issues raised by the pleadings and the issues argued in the District Court differ in certain important respects from the issues which the brief for the United States now undertakes to present as the issues to be decided.

The brief for the United States contains no specification of errors relied upon as required by Rule 21. It may be that this was intentionally omitted, because from an examination of the brief it appears that the United States has presented as issues and argued matters not covered by its assignment of errors (for assignment of errors see Record, Vol. 1, p. 1189).

We have no desire to be technical. On the other hand, the petition presented certain definite issues and it was these issues which the Defendants sought to disprove in the District Court and submits they did disprove. Had the petition presented the issues now presented by the brief for the United States the Defendants would have had an opportunity to meet and refute these issues as they refuted the issues actually raised.

At this stage of the case the United States is bound by the issues presented by the petition, argued in the District Court and raised by the assignment of errors.

For a general statement of the difference between the case presented by the petition and the case now

sought to be presented by the brief of the United States, we respectfully refer the Court to our reply brief, pp. 4 to 7.

In this memorandum we shall refer to three specific issues as to which the case now sought to be presented by the brief for the United States to this Court is materially different from the case presented by the petition and in argument in the District Court, viz.:

(1) The unlawful project charged.
(2) The provisions criticized in the leases.
(3) The monopoly claimed.

Issue as to the Unlawful Project.

The petition charges that the Defendants, in 1899, realized that the patents of the constituent companies were about to expire and devised the following unlawful project, namely (see Record, Vol. 1, p. 994):

(1) To acquire ownership or control of all concerns engaged in manufacturing and dealing in any and all kinds of shoe machinery; and

(2) Having done so to refuse to sell or lease any of the essential machines (defined as welt sewing and stitching, lasting, metallic fastening and heeling machines) to the manufacturer of shoes except on condition that he buy or lease of them practically all other machinery of whatever kind necessary or useful to him.

The petition alleges that all of the transactions specified in the petition were only steps in carrying

out this unlawful project (Record, Vol. 1, p. 994). *Under the allegations of the petition they are therefore material only in so far as they are shown to have been undertaken in pursuance of this unlawful project and only in so far as they assisted in carrying it out.*

The foregoing was the basic charge which the United States presented in the District Court. Unless it proved this charge, its case failed.

After the Defendants had introduced all their direct evidence counsel for the United States presented an amendment to their petition designed to make it conform to the case which they then contended they had proved (Record, Vol. 1, p. 881, p. 1101). While this amendment was not allowed, it shows the issue which counsel for the United States at the end of the trial declared to be the issue presented for decision.

In this amendment the United States charged that the Defendants conceived the plan of

(1) Acquiring all concerns engaged in manufacturing and dealing in any and all kinds of shoe machinery used in bottoming shoes (*i. e.,* used in adjusting and attaching the upper to the last in preparing the bottom and heel and fastening them to the upper and in finishing the bottom and heel of the shoe after such operations had been performed), and

(2) Upon such acquisition refusing to sell or lease any of the essential machines except on condition that the shoe manufacturer should buy or lease of the defendants practically all of the machinery necessary or useful to him.

In the petition as sought to be amended it was still

alleged that all the transactions referred to were merely steps in carrying out this unlawful project.

The United States has now in its brief in this Court abandoned this basic charge on which the petition is founded. It does not now charge that the Defendants planned to acquire all concerns engaged in the shoe machinery business, or even all concerns engaged in the manufacture of machines for bottoming shoes. It merely charges that the Defendants have acquired some competing concerns. Furthermore, the United States does not now charge that the Defendants planned to refuse to lease essential machines unless the shoe manufacturer took all other kinds of machines from them. At most, it claims that the effect of the leases is to induce (or, as the United States alleges, to compel) shoe manufacturers to take a limited number of other essential machines in addition to those desired, which machines form only a very small portion of the total number and types of machines furnished by the United Company and a still smaller proportion of the total number and types of the machines which the shoe manufacturer requires.

It will thus be seen that the basic issue as presented by the petition and as modified by counsel for the United States at the end of the trial has now been abandoned and a quite different issue presented, such issue being (see brief for U. S., pp. 301, 302) that there was competition between the constituent companies forming the United Company; that there was competition between the United Company and certain concerns which it later acquired and that the

leases have the effect, not of requiring a lessee taking one or more essential machines to take all other kinds from the United Company, but of inducing him to take and use a certain limited number of other types of essential machines.

The issue so presented is quite different from the issue presented by the pleadings and tried in the District Court. The evidence introduced by the Defendants was intended to meet and disprove, as it conclusively did, the issue presented in the District Court. While we submit that it also incidentally disproved the issue now presented, it is obviously unfair to the Defendants that the issue should now be materially changed, and that a new issue, not directly before the District Court and only incidentally touched upon, should be presented to this Court.

Issue as to the Leases.

As we have shown above, the petition charged that the provisions in the lease and license agreements which are criticized by the United States were only one step in carrying out the unlawful project alleged to have been conceived by the Defendants in 1899. This remained the contention of the United States during the trial, as is shown by the proposed amendment to the petition which it sought to have allowed towards the close of the trial. (Record, Vol. 1, p. 1101.)

In the argument before the District Court, however, counsel for the United States abandoned this contention. They admitted that the Defendants at

the time they formed the United Company did not have in mind the adoption of the leases which they later developed and contended that the intent which prompted the development of these leases was "absolutely immaterial" (see our main brief, p. 234). They thus abandoned the theory that these leases were adopted in pursuance of and in order to carry out the unlawful project which formed the basis of their entire case.

In the brief now filed the United States departs from the position it took at the argument in the District Court and apparently does contend that the leases were adopted as part of some general plan to monopolize. As the record does not support this contention and as it is inconsistent with the admission made by counsel in argument before the District Court, they also take the position then taken by them that even if the leases were not adopted as part of a plan to monopolize they are in and of themselves unlawful (brief for U. S., p. 154).

But this is not an issue before this Court. The leases are material in this proceeding only if it is shown that they were adopted in pursuance of the alleged unlawful project formed by the Defendants to acquire all shoe machinery concerns and then to refuse to lease any essential machines unless the shoe manufacturer took practically all his machines from the Defendants.

Furthermore, in its discussion of the provisions in the leases, the brief for the United States now criticizes provisions which were not referred to in the petition, or in argument in the District Court and

which are not referred to in the assignment of errors filed in taking the present appeal.

The petition charges in Section V that the defendants discontinued the sale of machines (Record, Vol. 1, p. 997) and unlawfully adopted arbitrary, oppressive and unlawful leases which

(1) contained provisions not found in former leases and which compelled boot and shoe manufacturers leasing any of such machines to agree to use exclusively one or more of the classes of machines included in the groups of machines made by the constituent companies upon penalty of having all of the machines included in said groups leased them by the Defendants reclaimed and the leases canceled;

(2) contained an agreement to take the machines for seventeen years;

(3) contained an agreement requiring the lessee to obtain all duplicate parts for the machines from the Defendants at exorbitant prices;

(4) provided in many cases that the lessee should, at the expiration of seventeen years, return the machines and pay a return charge which in some cases amounts approximately to the original cost of building the machines;

(5) contained a provision reserving to the lessor the right to cancel all leases if shoe manufacturers fail to use exclusively and to their full capacity machines leased from the Defendants.

The foregoing statement contained in Section V of the petition purports to be only a statement of the character of the provisions which the leases contain. The provisions which the petition contends are un-

lawful as carrying out the unlawful plan charged are specified in Section XII of the petition as follows (Record, Vol. 1, p. 1028):

(1) Covenants that the lessee shall use exclusively machines of the United Company to perform both the same kind of work as that performed by the leased machine and also all other kinds of work.

(2) A condition that should the lessee violate the above covenants he will thereby forfeit the use of all his leased machines of every kind.

(3) A covenant that the lessee shall use the leased machine for seventeen years.

The only clauses which counsel for the United States relied upon in the District Court to prove its contentions are enumerated by Judge Dodge in his opinion (R., Vol. 1, p. 1156), and are as follows:

(1) The full capacity clause.

(2) The additional machinery clause.

(3) The exclusive use cancellation clause.

(4) The prohibitive clause, *i. e.*, the restricted use clause.

(5) The right to terminate all lease clauses, *i. e.*, the cancellation for breach clause.

As Judge Dodge points out the full capacity clause and the additional machinery clause were not expressly referred to in the petition; the additional machinery clause was eliminated from the leases some years prior to the filing of the petition, and it was conceded by counsel that both these clauses "might be unobjectionable" if not used together with the other clauses. (Record, Vol. I, pp. 1156-57.)

In the amended petition which the United States

sought to have allowed at the end of the trial (Record, Vol. 1, pp. 1101-1103), it specified expressly the clauses in the leases which it claimed proved its contentions, viz:

(1) The full capacity clause.

(2) The additional machinery clause.

(3) The exclusive use cancellation clause as it interpreted that clause.

(4) The restricted use clause.

(5) The cancellation for breach clause.

(6) The provision admitting the validity of patents.

(7) The agreement that the leases should run for seventeen years.

The United States refers to the leases only in VII, VIII and IX of the assignment of errors. The VIIth assignment of errors is to the refusal of the court below to adjudge illegal the restricted provisions in the lease and license agreements, as described in Part V of the Bill and agreements containing like or similar provisions.

The VIIIth assignment of errors is to the refusal of the court below to enjoin and restrain Defendants from enforcing any rights claimed by virtue of such restricted provisions of the leases.

In the IXth assignment of errors the use of the word "Defendants" in the sixth line from the end leaves the meaning of the paragraph doubtful. In any event, this assignment can only be intended to refer to the restricted use clauses.

No other assignments of error claim error of the court below with respect to the provisions of the leases.

In other words, the assignment of errors refers only to the particular provisions described in Part V of the petition.

In its present brief, however, the United States attempts to contend that the following clauses are unlawful, although they were not referred to in the petition, although they were not relied upon in argument or made an issue in the District Court and although they are not referred to in the assignment of errors. These clauses now relied upon by the United States for the first time to sustain its contentions are as follows:

(1) The royalty clause in the leases of Goodyear machines providing for payment of royalty based on the lessee's factory production (Brief for U. S., pp. 167-169).

(2) The royalty provisions of the Clicking machine lease (brief U. S., pp. 169-170, 178).

(3) The clause in leases of metallic machines requiring the lessee to obtain from the United Company fastening material used in the machines (Brief for U. S., pp. 166, 171, 294-296).

(4) The royalty clause in the leases of pulling over machines (Brief for U. S., pp. 170, 178).

(5) The royalty provision in Exhibit 31, a form of lease for metallic machines, providing that an increased price not in excess of 10 per cent may be charged where the machine is not used as part of a series (Brief for U. S., pp. 171, 172).

(6) Various other clauses alleged to be oppressive and coercive and referred to in the brief for the U. S., pp. 187-189.

As we have stated *none of the foregoing clauses*

was referred to in the petition or relied upon in the District Court and no error has been assigned with respect to any of these clauses.

Even if the United States could have properly referred to these clauses in the District Court to sustain its contentions in spite of the fact that they are not specified or referred to in the petition, it is obvious that having failed to rely upon them in the District Court, and further having failed to assign error in respect to them, the United States can not now rely upon them in this court.

Furthermore, we submit that the provisions which were actually referred to and discussed before the District Court are material in the present case only if and to the extent that they are of the character which the petition alleges them to be. The petition alleges them to be unlawful: (1) in that they require the lessor to covenant that he will use machines of the kind leased and of all other kinds leased exclusively; (2) in that they provide that the lessor may cancel all leases if such covenants are violated; and (3) in that they provide that the lessor shall use the particular machine or machines leased for seventeen years. (Record, Vol. 1, p. 1028.)

We submit that the only provisions which conform to these allegations are the full capacity clause and the seventeen-year term, which do provide that the lease shall run for seventeen years, and that the lessee shall use the leased machine or machines so far as he has work for the machines to perform on which he is authorized to use them. (See our main brief, pp. 244-247.)

Finally as Judge Dodge points out, the petition does not contest the lawfulness of the lease system employed by the constituent companies in 1899 at the date of the formation of the United Company (Record, Vol. 1, page 1154).

The contention in the petition is that the Defendants were not content with the lawful monopolies and lawful methods of doing business which existed in 1899 and that they therefore conceived the unlawful plan of combining the constituent companies, acquiring all concerns engaged in the shoe machine industry and refusing to lease essential machines unless the shoe manufacturer took all of the machines from them. In pursuance of this plan it is alleged they "discontinued" the sale of machines and "devised, adopted and put into effect arbitrary oppressive and unreasonable lease and license agreements" which contained provisions "not found in their former leases and license agreements." These provisions the petition undertakes to describe. (Record, Vol. 1, p. 997.)

In other words, the petition only contests the lawfulness of new provisions and clauses employed for the first time by the Defendants and not previously used by the constituent companies. As Judge Dodge pointed out (R., Vol. 1, page 1154), these are the only provisions which the United States may properly rely upon to prove its contentions.

Considering the provisions referred to in the petition in this light, it is obvious that most of them are not material in the present proceeding. For example:

The leases of the constituent companies in most

cases ran for more than seventeen years (see our main brief, pp. 269). The adoption of the seventeen year term was therefore not a new oppressive provision but on the contrary it in most cases reduced the term previously employed.

The leases of the McKay Company contained the exclusive use cancellation clause. (See our main brief, p. 269.) The leases of the Consolidated Company contained the additional machinery clause and the Goodyear turn lease contained a lease requiring the lessee to use the Goodyear turn machines exclusively. (See our main brief, p. 261.) The substitution in place of these clauses of the exclusive use cancellation clause which recognizes the right of the lessee to take his additional machines from competitors and merely reserves to the lessor a right to withdraw its own machines of the same kind in such case, is clearly not the adoption of a more oppressive clause.

The auxiliary restricted use clause restricting the use of auxiliary machines was employed by the constituent companies. (See our main brief, p. 268.)

The repair parts clause was used by all the constituent companies (see our main brief, pp. 259-268).

The leases of the constituent companies permitted the lessor to cancel the lease for violation of agreements obligatory upon the lessee.

The Goodyear Company employed the restricted use clause in leasing its ideal machine restricting the use of this machine to the use with the Goodyear Welter and Stitcher (see our main brief, p. 261).

The full capacity clause was used in the Consoli-

dated Company's lessees (see our main brief, page 269).

An examination of the changes made by the United Company thus shows that the only changes in the leases which the United States can possible contend were (1) occasioned by the use of provisions referred to in the petition or in the District Court and (2) which resulted in additional restrictions upon lessees are the use of the full capacity clause in all leases of machines for which a royalty based on use is charged; and a more extensive use of the restricted use clause.

Issue in Respect to Monopoly.

The petition, as filed in the District Court, charged a plan to acquire and a monopoly acquired of all shoe machinery, and the United States undertook to prove this charge. (See our main brief, p. 11.)

After the United States had introduced its direct case, counsel for the United States limited the charge of monopoly to an attempt to acquire a monopoly and a monopoly acquired in

> "machines for preparing and attaching the bottoms to the uppers of boots and shoes, the eyeletting machines and the clicking machines." (See our main brief, p. 14.)

In its proposed amended petition the United States similarly sought to amend the scope of the petition. (Record, Vol. 1, p. 1101).

By thus abandoning the charge of an attempt to monopolize and a monopoly of all shoe machinery

and limiting it to a charge of an attempt to monopolize and a monopoly of bottoming machinery, clicking and eyeletting machinery, the United States eliminated from the charge of monopoly considerably more than half the total number of machines used by the ordinary shoe manufacturer in his factory. (See our main brief, pp. 606, 607.)

The United States in this Court has attempted to limit its charge still further. Instead of charging monopoly of all bottoming machines, clicking and eyeletting machines, it now disclaims any monopoly of general department machines, a large number of which are used in preparing the bottoms of shoes and in the bottoming process. Furthermore, at page 150 of its brief, the United States apparently limits its charge of monopoly to twelve machines enumerated in the table which is there set forth. If it does not intend to limit its charge to these particular machines, it is quite clear from the record that it can not, with any possibility of reason, contend that there is any monopoly in respect to numerous other machines used in the bottoming process.

While the Defendants did not attempt to prove the number of machines of various types which its competitors put out, believing that it was for the United States to prove its case, and not primarily for the Defendants to disprove it, it definitely appears from the record that there are numerous machines used in the bottoming process which are furnished in large quantities by competitors and in respect to which it is impossible for the United States to claim.

with any reason, that a monopoly exists. For example, take the following machines as illustrations:—

Heel Building Machines,
made by W. J. Young Machinery Company (R., Vol. 1, p. 942), which has put out 2,000 to 3,000; also made by Thomas Bostock, who has put out 100 a year (R., Vol. 1, p. 904).

Fairstitching Machines,
made by Puritan Manufacturing Company, which had put out 1,000 (R., Vol. 1, p. 891).

Cementing Machines for Cementing Soles,
made by Boston Machine Works Company, which has put out 700 to 800 (R., Vol. 1, p. 927).

Heel Compressing Machines,
made by W. J. Young Machinery Company, which has put out over 300. The same concern has also put out various other types of heel-making machinery, including between 150 and 200 lift-gouging machines, and also counter making machinery—300 or 400 counter molding machines having been marketed (R., Vol. 1, pp. 942, 943).

Heel Finishing Machines,
137 made and put out by Harlow Shoe Finishing Machinery Company (R., Vol. 1, p. 942). Similar machines put out by Donnelly Machine Company, which sells 15 or 20 a year (R., Vol. 1. p. 944); by Beckman Machine Company

(R., Vol. 1, pp. 925, 926); and by Matson-Hoyt Machine Company (R., Vol. 1, p. 928).

Toe Softening Machines (to prepare box toe for lasting operation),

made by Beckwith Box Toe Company, 200 having been placed during two or three years (R., Vol. 1, p. 926).

Also machines for same purpose made and put out in considerable quantities by Carlson Brothers (R., Vol. 1, pp. 905-906).

Sole Cutting or Dinking Machines,

made by Quarmby & Hilliker, 150 to 200 put out (R., Vol. 1, p. 929).

Also made by Seelye Manufacturing Company (our main brief, p. 819), which sold 50 to 100 a year in 1899 and is still selling them (R., Vol. 1, p. 328).

Also made by Tower Brothers, who put out 10 or 12 a year (R., Vol. 1, p. 907).

Sole Channelers,

made by Hamel Shoe Machinery Company, and its predecessors, 70 put out (R., Vol. 1, p. 326).

Same concern has put out 20 types of bottoming machines to the extent of between 400 and 450 separate machines (our main brief, p. 810);

Also 70 to 80 channelers made by Haverhill Shoe Machinery Company (our main brief, p. 812).

Also 25 to 30 channeling machines made and put out by American Worsted Machinery Company (R., Vol. 1, p. 953).

Sole Molding Machines,
made by Haverhill Shoe Machinery Company which has put out 40 to 50. (R., Vol. 1, p. 292):
Also 35 made and put out by Hamel Shoe Machinery Company (R., Vol. 1, p. 326).

Sole Leather Rolling Machines,
made by Quarmby & Hilliker which has put out 50; same concern makes stripping machines, having put out 75 (R., Vol. 1, p. 929).

Insole Flap Slashing Machines,
made by Boston Machine Works Company, which employs 100 men and has put out 50 of these slashing machines besides many other types (R., Vol. 1, p. 927).

Welt Grooving and Beveling Machines,

Welt Beating Machines,
made by Hamel Shoe Machinery Company which has put out 25 of each (R., Vol. 1, p. 326).

Bottom Buffing Machines,
made by Donnelly Machine Company which puts out 18 to 20 a year (R., Vol. 1, p. 943).
Tower Brothers also make and put out 10 a year (R., Vol. 1, p. 907).

Numerous other bottoming machines have been made and put out by a score and more of other concerns. (See our main brief, pp. 808-834.)

The result is this:

The United States in the petition charged a mon-

opoly of all shoe machinery. It undertook to prove this charge at the trial and the Defendants were then called upon only to meet this charge.

At the end of the trial it limited its charge to a monopoly of bottoming machines, clicking and eyeletting machines, that is, to a monopoly of most of the types of machines which the United Company manufactures.

In this Court it has apparently undertaken to limit its case still more seriously. It has now chosen twelve machines (brief for United States, p. 150) out of some three hundred different types of machines which the United Company produces and charges that the United Company has a monopoly of these machines.

The character of these particular machines chosen by the United States is referred to in our reply brief (pp. 66 to 72). It is there shown that in respect to three of the machines, instead of the United Company putting out additional machines from 1900 to 1911, the number of machines which the United Company has under lease has actually been reduced. In respect to others, it is shown that they are entirely new machines invented by the United Company since its formation which perform operations previously performed by hand and which are strongly patented. In respect to the McKay machine, it is definitely shown that the United Company has furnished certainly less than half of the total machines in use. In respect to other machines, it is shown that at the time the United Company was formed practically all the

machines of that kind in use were owned by it; that it has put out a comparatively small number of these machines since that date, and in respect to several of these machines, notably the stitcher, a substantial portion of the increase in the number in use since 1900 have been put out by competitors, and the number of other manufacturers putting out welters, stitchers, lasters, nailing and heeling machines is larger and their capacity and power much greater than in 1899.

But apart from this failure of the United States to prove monopoly in respect to these machines, we submit that the question of whether the United Company has an unlawful monopoly of these few types of machines is a very different question from the issue presented by the petition, namely, whether the United Company has a monopoly of all machinery and a very different question from the issue presented by the United States in argument in the District Court and decided by the District Court, namely, whether the United Company has a monopoly of all the numerous types of bottoming machines, clicking and eyeletting machines.

It will be obvious to the Court that if the United Company had been charged in the District Court with a monopoly of twelve specified machines, or even of a slightly larger number out of the three hundred or more types which it manufactures, that it would have been able to direct its evidence specifically to these machines and the reasons for such success as it has had in furnishing these particular machines, and that its presentation of the case might,

and we submit, would have been very different from what it was in view of the very different charge presented in the District Court.

Respectfully submitted,

F. P. FISH,

CHARLES F. CHOATE, JR.,

MALCOLM DONALD,

Of Counsel for Appellees.

No. 545.

UNITED STATES OF AMERICA, APPELLANT,

vs.

UNITED SHOE MACHINERY COMPANY ET AL.

APPEAL FROM THE DISTRICT COURT OF THE UNITED STATES FOR THE DISTRICT OF MASSACHUSETTS.

BRIEF FOR GENERAL SHOE MACHINERY COMPANY (SUCCESSOR TO BOYLSTON MANUFACTURING COMPANY).

SYNOPSIS.

The Patents are Irrelevant,
for

I. What is Granted by the Patent Statutes
II. Is Not Denied by the Anti-Trust Act,
and (reversely)
III. What is Denied by the Anti-Trust Act
IV. Is Not Granted by the Patent Statutes.

V. Irrelevancy Stated in Terms of Procedure.

I. What is Granted by the Patent Statutes.

A. The Right.—(*i*) Its source and (*ii*) its scope.
B. The Remedy.—(*i*) Its source, scope and (*ii*) its exclusiveness.

A.

The Right.—(i) Its Source.

The right is created by the patent statutes.

Gayler *vs.* Wilder (1850), 10 How., at 494 (Chief Justice Taney):

> "The monopoly did not exist at common law, and the rights, therefore, which may be exercised under it cannot be regulated by the rules of the common law. It is created by the act of Congress; and no rights can be acquired in it unless authorized by statute, and in the manner the statute prescribes."

And so—

> [Brown *vs.* Duchesne (1856), 19 How., at 195 (Chief Justice Taney): Shovel Co. *vs.* Flint (1890), 137

U. S., at 43 (Mr. Justice Gray); Paper Bag Patent Case (1908), 210 U. S., at 423 (Mr. Justice McKenna).]

The Right.—(ii) Its Scope. The Right Is Negative.

Bloomer *vs.* McQuewan (1852), 14 How., at 549 (Chief Justice Taney):

> "The franchise which the patent grants, consists altogether in the right to exclude every one from making, using, or vending the thing patented, without the permission of the patentee. This is all that he obtains by the patent."

The other definitions do but clarify the one given:

> [Patterson *vs.* Kentucky (1878), 97 U. S., at 507 (Mr. Justice Harlan); U. S. *vs.* Bell Telephone Co. (1895), 167 U. S., at 238-239 (Mr. Justice Brewer); Paper Bag Patent Case (1908), 210 U. S., at 424 (Mr. Justice McKenna); Bauer *vs.* O'Donnell (1913), 229 U. S., at 10 (Mr. Justice Day).]

B.

The Remedy.—(i) Its Source and Scope.

It is created by statute, and consists altogether in the right to bring infringement suits (R. S., sections 4919, 4921).

The Remedy.—(ii) Its Exclusiveness.

Globe Newspaper Co. *vs.* Walker (1907), 210 U. S., at 364-365 (Mr. Justice Day):

> Import.—Where a statute creates a right and prescribes the remedy, the latter is exclusive and has no alternative.

Being exclusive, the remedy is the essence of the right. U. S. *vs.* Motion Picture Patents Co. (1915), D. C. Pa., 225 Fed., at 804):

> "It (*i. e.*, the patent) is the right to a remedy."

Paper Bag Patent Case (1908), 210 U. S., at 430 (Mr. Justice McKenna):

> "It hardly needs be pointed out that the right can only retain its attribute of exclusiveness by a prevention of its violation. Anything but prevention takes away the privilege which the law confers upon the patentee."

That was said of the statutory action for infringement.

Restating the foregoing in the nomenclature of commerce: *A patent* (if valid, otherwise it is no patent) *is a grant of the right to exclude competition in the thing patented by means of infringement suits in the courts of the United States and not otherwise.*

Of course, the suits may fail; the patent may be declared invalid or not infringed. The right has only a *prima facie* validity, and the article sought to be excluded may be a commercial, but not a patent law, equivalent. The ultimate validity of a given patent right cannot be established, its scope cannot be measured, except by infringement litigation. The patent is a right to litigate; nothing else. And such terms as "patented machine" and "infringing machine" are argumentative, unless or until a court, in the particular instance, has by its decree infused them with finality.

(i. e., What Is Granted by the Patent Statutes)

II. Is Not Denied by the Anti-trust Act.

The anti-trust act does not prohibit the exclusion of competition by infringement suits. In an infringement suit by the patentee to exclude competition, it is no defense that he is a party to a contract, combination, or conspiracy in restraint of trade; the anti-trust act and its prohibitions are irrelevant.

No ruling on the point by this court has been found, but there are decisions elsewhere.

Strait *vs.* National Harrow Co. (1892, C. C.), 51 Fed., at 820 (Judge Wallace):

> "In a suit brought for the infringement of a patent by the owner, any such inquiry (as to the patentee's being a party to an unlawful combination) at the behest of the infringer, would be as impertinent as one in respect to the moral character or antecedents of the plaintiff in an ordinary suit for trespass upon his property."

Likewise:

> [Edison El. Light Co. *vs.* Sawyer-Mann Co. (1892, C. C. A.), 53 Fed., at 598; Soda Fountain Co. *vs.* Green (1895, C. C.), 69 Fed., 333; General Electric Co. *vs.* Wise (1903, C. C.), 119 Fed., 922.]

Therefore, *in a suit by the United Company for the infringement of one of its patents mentioned in this record, the allegations and proofs in the record concerning the contracts and their illegality under the anti-trust act would be impertinent.*

The validity and scope of patent rights, and the right to prosecute an infringement suit, are not contingent upon, and cannot be measured by, either the anti-trust act or contracts charged to be illegal thereunder.

III. Reversely, (A) What is Denied by the Anti-trust Act

IV. (B) Is Not Granted by the Patent Statutes.

A. The Scope of the Denial.

The prohibitions, as respects instrumentalities, are confined to contracts, combinations, in the form of trust or otherwise, and conspiracies.

> As to the rule of interpretation and construction of the statute as applied to such instrumentalities of exclusion: Standard Sanitary Mfg. Co. *vs.* U. S. (1912), 226 U. S., at 49 (Mr. Justice McKenna):
>
> > "The law is its own measure of right and wrong, of what it permits, or forbids, and the judgment of the courts cannot be set up against it in a supposed accommodation of its policy with the good intention of parties and, it may be, of some good results."

(*i. e., What Is Denied by the Anti-trust Act*)

IV. (B) Is Not Granted by the Patent Statute.

The right to contract, combine, or conspire, in any regard or for any purpose, is not sanctioned by the patent law.

U. S. *vs.* Bell Telephone Co. (1886, C. C.), 29 Fed., at 43 (Judge, afterwards Mr. Justice, Jackson):

> "In permitting others to *use* the patented thing, the owner of the patent, whether a corporation or a private person, is not exercising any Federal right, privilege, or franchise. The right of the patent owner to permit or license the use of the invention is not the creature of the Federal franchise or statute, but of the common law." (Italics in the text.)

Minnesota *vs.* Barber (1890), 136 U. S., at 327 (stating the import of the earlier decision in Patterson *vs.* Kentucky, Mr. Justice Harlan):

> "We said that the patent was not a regulation of commerce, nor a license to sell the patented article but a grant that no one else should manufacture or sell that article, and, therefore, a grant simply of an exclusive right in the discovery which the national authority could protect against all interference;"

The same reasoning is implicit in the decision heretofore cited on the source and scope of the patent right.

As this is the crux, perhaps it is permissible to dwell upon it for a few sentences. The legality of a lease contract, whether it permits the use of a machine or a tenement house, is not dependent upon and cannot be measured by the patent statutes, or by the right of the lessor to maintain an infringement suit. The rights of lessor and lessee in *the specimen machine leased* would not be affected by a repeal of the patent statutes. The rights conferred by the lessor and the duties assumed by the lessee *with respect to that specimen* are created by and are dependent upon the contract, and not the statute: take away the contract and they disappear.

Reciting the patents in the leases cannot alter the patent law which grants the right to exclude competition only by an infringement suit; reciting them in the answer cannot alter the Anti-Trust Act which condemns the exclusion of competition by contracts, combinations, or conspiracies. Both recitals are irrelevant in the respective connections.

The application is to be seen in two decisions: one by this court, and one by a lower tribunal. The latter is mentioned first only because the attempt to stretch the law (as seems

to counsel) went to an extreme not equalled in the other instance.

U. S. *vs.* Patterson (1913 D. C.), 205 Fed., 292, S. C., on appeal.

Patterson *vs.* U. S. (C. C. A. 6th), 222 Fed., 592.

Here the defendants—officers and agents of the National Cash Register Company—were indicted for organizing and carrying out a conspiracy in restraint of trade in cash registers. One defense, insisted on with elaboration, was that the trade restrained, if any, by the conspiracy, was a trade in devices which infringed the defendants' patents. The contention was that since the defendants had a right to exclude competition under their patents, there was no violation of the law in restraining such trade by the conspiracy.

The District Court ruled that the patents were irrelevant as a defense and *denied their admission in evidence.*

L. c. 205 Fed., 297 (District Judge Hollister):

> "A part of the patent right is the expressly granted power to bring suits to exclude all infringers. The patentee has no sanction under the patent laws to exclude infringers in any other way."

The ruling of the District Court on the point noted was affirmed by the Court of Appeals. Mr. Justice Day and District Judges Sandford and Cochran sat, the latter delivering the opinion, *l. c.*, 222 Fed., 646:

> "It is not a question whether it is rightful or wrongful interstate trade or commerce that is covered by the conspiracy. It is sufficient that it is interstate trade or commerce."

It is decided, then, *that a conspiracy which restrains interstate trade even in infringing articles violates the Anti-Trust Act; such conspiracy is not sanctioned by the patent*

law. The patents are irrelevant as a defense to such conspiracy.

The other case is

Standard Sanitary Mfg. Co. *vs.* United States (1912), 226 U. S. (Mr. Justice McKenna).

There the court condemned, as illegal under the Anti-Trust Act, a combination in restraint of trade in enameled ware. The nucleus of the combination was a patent: and the restraint took the form of a system of license contracts under the patent. The defense was that the restraint was sanctioned by the patent statute and consequently not to be condemned under the Sherman law.

The court placed the scheme in a class with one condemned in Montague *vs.* Lowry, 193 U. S., 38, *where there was no patent*, and thereupon thrust the patent out of the case with a sentence, *l. c.*, 49:

> "The added element of the patent in the case at bar cannot confer immunity from a like condemnation, for the reasons we have stated."

It is decided, then, by this court, that a system of license contracts under a patent which restrains interstate trade in the articles made under the license violates the Anti-Trust Act; such restraint by contract is not sanctioned by the patent law. The patent is irrelevant as a defense of such restraint.

The "added element" of the copyright has been similarly dealt with. Straus *vs.* Am. Publishers' Ass'n (1913), 231 U. S., at 234-235 (Mr. Justice Day).

Summarizing the Preceding.

The patent law is a statute of grant; it authorizes the patent owner to exclude competition by infringement suits (if he can; many times the attempt fails).

The Anti-Trust Act is a statute of prohibitions or denials;

it denounces the exclusion of competition by means of contracts, combinations or conspiracies. One statute creates rights to bring infringement suits; the other makes certain contracts, combinations and conspiracies crimes.

There is no conflict beween the two enactments; neither carves an exception out of the other. They sanction rights and duties in two separate domains.

In a suit for the infringement of *a patent right*, the Anti-Trust Act and the *duties enjoined by it* are without the issue and irrelevant.

In a proceeding to enforce the *duties enjoined* by the Anti-Trust Act, the patent statutes and *rights* granted thereunder are without the issue and irrelevant.

Whatever judgment this court enters in this proceeding cannot abridge or impair the right of the patent owner to prosecute infringers. "And this is all that he obtains by the patent" (Bloomer *vs.* McQuewan, *supra*).

To expand the right of every patent owner to bring infringement suits, so as to include the right to enter into and carry out contracts, combinations and conspiracies in restraint of interstate and international commerce (all of which are crimes) would be to wrench both the patent statute and the Anti-Trust Act out of their declared functions and make each of them

> "mean not what it says, but what interested parties wish it to mean at a particular time and under particular circumstances" (Northern Securities Co., *vs.* U. S., 193 U. S., at 350, Mr. Justice Harlan).

The Patents Are Irrelevant.

V. The Same Result Stated in Terms of Procedure.

In this proceeding the court cannot adjudicate the validity or invalidity of the patents. There is no such issue.

This court has held that the only way in which the United States can attack or question the validity of a patent, is by

a bill in equity, to have the patent cancelled for fraud in its procurement (U. S. *vs.* Am. Bell Telephone Co., 128 U. S., 315).

This is not such a proceeding, and, therefore, a judgment declaring the patents *invalid* would transcend the record that is, as well as one that could have been made.

The court cannot adjudicate the patents *valid,* for their validity has not been challenged; there are no infringers or alleged infringers before the court, and no other person that could be bound or affected by the judgment in that regard. The allegations in the answer of the existence, scope and validity of the patents go in the air.

The court will not *assume* the validity or invalidity of the patents in determining the legality of the contracts. For, the legality of the contracts is determinable under the Anti-Trust Act; the validity of the patents under the patent statutes. To decree the legality or illegality of the contracts upon the assumption of the validity or invalidity of the patents would be as extraordinary as (in a patent case) to decree the validity or invalidity of the patents upon an assumption of the legality or illegality of the contracts. Rights under the patent statutes are not contingent upon the violation or assumed violation of duties enjoined by the Anti-Trust Act; duties under the Anti-Trust Act cannot be absolved by rights or assumed rights under the patent statutes.

All the space and learning devoted to patents and the patent law on this record are as entirely foreign to the issue involved as all the space and learning devoted to contracts and the Anti-Trust Act would be to the issue in a suit for the infringement of one of the United Company's patents. For, the statute of which the court has here to find the meaning—

> "is a criminal statute. The two sections on which the Government relies both make certain acts crimes. That is their immediate purpose and that is what they say. It is vain to insist that this is not a crimi-

> nal proceeding. The words cannot be read one way in a suit which is to end in fine and imprisonment and another way in which one seeks an injunction" (Northern Securities Co. *vs.* U. S., 193 U. S., at 401, Mr. Justice Holmes, *dissenting*).

In such "a criminal proceeding" this court is asked to adjudicate or assume the validity of the whole jangled mass of patents and thereupon to sanction the exclusion by these contracts of all competitors for 17 years without giving such competitors any opportunity to contest the validity of the patents or to prove the noninfringing character of their devices. This would be the equivalent of granting to the defendants a patent on the industry, for the contracts exclude competition without regard to an *adjudication* of the validity or scope of the patents or the noninfringing character of the excluded machines.

The court declined so to do with respect to the Arrott patent interposed as a defense in the *Standard Sanitary Case, supra,* and the wisdom of the refusal has been demonstrated. For, after this court condemned the scheme to exclude competition by license contracts under that patent, the Circuit Court of Appeals for the Third Circuit, which previously had twice sustained the validity of the Arrott patent, on the third round declared it void (Standard Sanitary Mfg. Co. *vs.* Iron City Mfg. Co., 222 Fed., 671).

For aught that this court can know from this record, what is true of the Arrott patent may be true of every patent that the United Company now owns or ever has owned.

The patents are irrelevant.

Conclusion.

Finally (and this is repetition) the patents are irrelevant for the reason that the condemnation of the restrictions and all of them, will not take from the patent right one jot or tittle.

Victor Talking Machine Co. *vs.* The Fair (1903 C. C. A., 7th), 123 Fed., at 426 (Judge Baker):

"Within his domain, the patentee is czar."

No doubt there is a truth in the connotation, for this court has held that every citizen, including (under many circumstances) the officers of the Government, must respond to a charge of infringement. But the domain of this czar is bounded north, south, east, and west by the right to exclude, and the only sceptre that he wields is an infringement suit, which is not always compelling. Congress by the Anti-Trust Act has established another domain; one in which all interstate trade and commerce must be free from restraints by contracts, combinations, or conspiracies; and in the midst of that domain has placed the jail as a warning to all invaders. The patentee is as powerless in this wider domain as the public and officers of the Government are in his narrower one. They must bow to his prerogative when it is sanctioned by the process of the courts in infringement suits. He in turn must bow to the will of the public sanctioned in the Anti-Trust Act.

The czar in this case has abandoned his domain and invaded one in which there are no rights and in which he has no more immunities than any other citizen.

The Case as a Whole.

This is a case "of great expectation" (Wheaton *vs.* Peters (1834), 8 Peters, at 655, Mr. Justice McLean).

It is feared that the greater part of what is herein written (and much more that has been ruminated) is a vain repetition of truisms which may weary but cannot inform the court.

Aside from the intercorporate relationships of the defendants (matters not touched on here) the case propounds a single astonishing question: *Can one who has the right to*

attempt the exclusion of competition by infringement suits, in the name, but not in the exercise, of that right, actually exclude competition by a system of contracts creating a vast combination?

Throughout there are two statutes and two instrumentalities for excluding competition. These are paired: the patent statute and an infringement suit; the Anti-Trust Act and a contract. One instrumentality is given and one taken away. Congress by the patent statute has created the infringement suit out of the void; the same Congress by the Anti-Trust Act has destroyed the contract, and in destroying has transmuted it into a crime. The defendants contend that the mere *possession* (it is not employed) of the *legal* instrumentality authorizes them to substitute therefor and use instead the *criminal* instrumentality.

The truly titanic effort of the defendants; the origin of the shoe machinery business in the long ago, under the protecting ægis of the patent law; its history and perfectly normal growth in which, with the aging of the art, patents have fallen in ever-increasing numbers, like manna from the heavens; the far-seeing beneficence of the United Company, which, in binding the shoe manufacturer to use only its machines, has precluded the calamity incident to the ignorant choice of a competitor's; the welters, sluggers and stitchers, the principals and auxiliaries, that work in teams, but balk when singly hitched; the tying clauses that do not tie; the excluding clauses that do not exclude; the return charges which preclude a return; this and more, elaborated with patience, illuminated with ingenuity and informed from beginning to end with a protestation of good intentions, bursting from the heaving depths of counsel's heart with a violence that brooks no denial; and all and more sanctioned by the District Court;—comes finally to this pass.

For no ingenuity of argument, no violence of protestation and no amplitude of citation can efface or conceal the capital fact (to a bare statement of which in one sentence, but for

hazarding an imputation of a design to affront the court, this brief might well be confined): *that the system of reticulated restrictions is only "a commercial device"* (Packet Co. *vs.* Bay, 200 U. S., 179, Mr. Justice Holmes) *whereby, as instrumentalities for excluding competition, contracts are substituted for infringement suits.*

By the substitution the effort is made to invest the contract with the protective coloration of the patent right, so that the court, being powerless to deal with the latter, will not lay hands on the former.

Whether or not the substitution shall be sanctioned rests with this court. One may not strive with the court, but perhaps it is permissible to hazard the prediction that if the substitution is sanctioned the driven piles of the Anti-Trust Act and of the anti-monopoly statutes of every State in the Union will creel, and the greater part of those structures will tumble down in ruins.

The patents are irrelevant, for they are a disguise.

Respectfully submitted,

FRANK Y. GLADNEY,
Amicus Curiæ.

SYNOPSIS.

The Leases.

Legality of the Restrictions, — that is the issue:

Preliminarily.

Benefits conferred or offered by the lessor extraneous the lessor's contractual obligation are irrelevant, for such benefits

Page

A. are not obligated of the lessor or secured to the lessee by the leases and . . . 1

B. are not affected by the Anti-Trust Act . . 3

The Restrictions.

I. Preliminarily to the scope and effect of the restrictions: They are genuine restraints of trade and not mere "reservations" or "grants" of "limited rights" 4

II. The exclusive use clause, in the category of a given type, excludes the use, by the lessee, of any competitive equivalent specimen for seventeen years 10

III. The prohibitive use or tying clause generalizes the effect of the exclusive use clause in the category of different types. 12

IV. Each is an integral function of the other; correlated and interacting, they exclude the use by the lessee of any competitive equivalent specimen (machine or material) of any and every type embraced throughout the seventeen years. 14

Page

V. The machines (and with them their accessory materials) are integrated into the system of restrictions in such fashion that the maximum degree of the lessee's dependency on the lessor for any particular type of machine, at a given point of time, is, by the lessee obligatorily assumed, in undiminished degree throughout 17 years, as respects every specimen machine (and its restricted material, if any) of every type embraced. **This is the master principle pursuant to which all the machines and materials are contractually articulated into one unit** 15

VI. The cancellation clause aggravates the evil of the restrictions; judicial inquiry into the legality of even the least of them can be invoked by a lessee, only at the hazard of losing his effective equipment 25

VII. Conclusion: the intent of the defendants is attested by the language of the restrictions: commendation of the restrictions by certain lessees is an inevitable concomitant of the lessor's power over all lessees 29

SUPREME COURT OF THE UNITED STATES.

OCTOBER TERM, 1917.

No. 207.

UNITED STATES OF AMERICA, APPELLANT,

v.

UNITED SHOE MACHINERY COMPANY ET AL.

APPEAL FROM THE DISTRICT COURT OF THE UNITED STATES FOR THE DISTRICT OF MASSACHUSETTS.

BRIEF FOR GENERAL SHOE MACHINERY COMPANY (SUCCESSOR TO BOYLSTON MANUFACTURING COMPANY).

PART II ON REARGUMENT.

The legality of the restrictions of the leases is the issue.

A. The Benefits Urged are Not Obligated of the Lessor, or Secured to the Lessees, by the Leases.

In the attempt to justify the restrictions there is relentless insistence on the surpassing merit of the machines, the benefits of the lessor's "service" to the lessees, and the lessor's offer of "independent" leases as the alternative of the restricted leases.

But those things are no part of the lessor's contractual obligation. It nowhere undertakes to furnish the "best machines made". On the contrary, the lessee by the

terms of the leases is compelled to use the machines furnished exclusively for seventeen years, even though during the period the "best machines made" are at the disposition of some one other than the lessor. Indeed, the lessee is expressly prohibited from changing, altering or improving the machines without the written consent of the lessor.

The lessor is not obligated to furnish "any service"; "free of charge" or otherwise. On the contrary, the lessee is expressly bound at his own expense to keep the machines in good repair; to purchase all parts exclusively from the lessor (provided it will supply them; it is nowhere bound to do so) at such prices as it sees fit to establish, unrestrained by any provision in the leases. The lessor is the sole judge as to when repairs are needed, what they are, and what they shall cost. The lessee has but to submit and pay.

The reiteration of the "independent" leases is incessant; it suggests a power riveter.

But, again, the "independent" leases are no part of the restricted leases. The latter do not so much as give the lessee the option to put off his dependence and take on independence. The utmost that is claimed is that when (and as often as) the restricted leases were signed and put into effect the lessor was ready and willing to grant the "independent" leases instead.

However, the restricted leases, as such (without any alloy of freedom to the lessee), long have been, are now, and, by their terms, long will be, in effect. The "independent" leases, in so far as they are related to the restricted, are only a memorial of a freedom once tendered and declined. *Why* this is so is much disputed. Defendants say the lessees prefer the lessor's machines for use exclusively "in series" or as "a team". On the other hand it is asserted that the terms of the "independent"

leases are prohibitive. But the fact that the one set of leases have been executed and are being carried out from year to year while the other set, as to lessees bound by restricted leases, are only past potentialities, is not questioned.

It is obvious, then, that the terms of the "independent" leases are irrelevant to the legality of restrictions in the restricted leases.

If some "independent" leases have been executed and are in effect, then their legality must be determined by their contents. But their mere offer cannot affect the legality of the restricted leases.

The legality or illegality of what has been agreed upon and carried out cannot be even remotely contingent upon the legality or illegality of something else that might have been (but was not) agreed upon.

In the domain of private law a tender of one's obligation may be the equivalent of performance, but this cannot obtain between a citizen and the sovereign. The latter exacts actual obedience of its mandate and rejects an alternative whether tendered or performed. This court must break new ground before an asserted willingness to obey the law will justify its actual disobedience. The lessors may not put into effect the restricted leases and over them erect its antecedent, unexecuted alternative as a lightning rod to ground the incidence of the statute.

B. Such Benefits are Not Affected by the Anti-Trust Act.

Against "the best machines made", "service free of charge", the "instruction of operators free of charge" and "independent" leases (assuming the thing is what its name implies) there is no law. If the court should annul all the restrictions complained of the lessor would still be free to offer all these benefits "free of charge" and the lessees free to accept them and to use the machines "in

series" or as "a team" to the complete exclusion of other machines and materials, *although* they would not as now be obligated so to do for seventeen years.

Throughout the argument the defendants stoutly maintain that the use of the United Company's machines to the almost complete exclusion of other makes is due solely to the superior excellence of the lessor's machines and the surpassing "service" afforded. But after the removal of all the restrictions that excellence and "service" would still have all the commercial potency that they now have. The Anti-Trust Act has to do exclusively with contracts, combinations and conspiracies. It has no pertinency to unobligated gratuities, whether in the form of purely philanthropic offerings or of sops thrown by a commercial autocrat to its grimacing victims to dissipate the rancor of their dependency.

I.

Preliminary to the scope and effect of the restrictions: they are genuine restraints of trade and not mere "reservations" or "grants" of "limited rights".

Before attempting to present the scope and effect of the restrictions it is necessary to meet the defendants' denial of the essential restrictive nature of them. The great number of restrictions, their intricate correlation and the mystifying indirection of their phraseology certainly are without precedent among the decisions of this court. Yet they all may be reduced to the principle of either (1) the exclusive use clause or (2) the prohibitive use or tying clause.

(1) The *exclusive use clause* (invariably characterized by defendants as "the exclusive use *cancellation* clause") provides in express terms that if the lessee of a lasting machine (for example) shall fail or cease to use exclusively

lasting machines of the lessor, the lessor may at its option "terminate forthwith by notice in writing this lease and any other lease of lasting machines", etc.

It is denied that this language imposes any restraint upon the lessee as to his right to use competing machines of the character. The contention is that the provision does not bind the lessee not to use competing machines, but only reserves to the lessor the right to withdraw its own in case he does. This refinement is much stressed by defendants, but a slight inspection shows that it is a mere verbal argument and that it ignores the effect of the reservation as a restraint upon trade. For, consider the correlative rights and duties of lessor and lessee in the leased machine, before and after the lessee's use of a competitive machine. Thus

I. Before using competitive machine.

LESSOR.	LESSEE.
Duty: to permit use for 17 yrs.	Right: to use for 17 yrs.
Right: to cancel, if etc.	Duty: to pay taxes, return charges, etc.

II. After using competitive machine.

Duty: none.	Right: to use at will of lessor.
Right: to cancel, absolute.	Duty: to pay taxes, return charges, etc.

By the use of a competitive machine, the lessee's right and the lessor's duty as respects the leased machine, *in the category of time*, are destroyed, and the lessor's right to cancel is transmuted from a contingent into an absolute right, but (and it is not without a premeditated effect) the lessee's duty remains as before. If the lessor reserved the right to double the royalty (instead of cancelling the

lease) in the event of the use of a competitive machine, the restraint on the lessee would be undeniably obvious. The transmutation of rights and duties in point of time and security of tenure is just as certainly a restraint and one of more deterrent power than an increase in royalty. The burden of an increased royalty may be sufferable, it can be foreseen and its incidence is calculable. But the insecurity and uncertainty of the lessee's situation, incident to the daily recurring hazard of losing an important part of his equipment at the unpredictable choice of the lessor, is superlatively dissuading. It is to be observed that the use of *one* competitive machine (of the type nominated in the clause) even though for but a brief period gives the lessor the right forthwith to retake *all* its own of the same character. The minimum displacement of the lessor's machines, whether in point of number or time, suffices to draw the maximum penalty in both measures. It will shortly be shown that this deadfall, on a huge scale, is erected likewise over all other machines put out under the leases complained of.

The *additional machinery clause* (is in effect an equivalent of the exclusive use clause and) provides in express terms that if the lessee has more work of the kind which can be performed by any of the machines of the lessor (*i. e.*, of the particular type specified) than the capacity of the machine leased, then (1) the lessee shall either take from the lessor sufficient additional machinery to perform the work or (2) in case the lessee fails to do so then the lessor may cancel forthwith "this lease and any other lease" covering machines of the character.

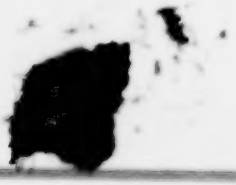
Defendants seek to minimize its significance in this proceeding by the statement that it was discontinued in 1907. In view of the fact that the leases run for seventeen years, the clause can scarcely be said to possess only an historical interest. The net result of substituting the

exclusive use, for this clause, is that the lessee's express obligation to take the additional machines exclusively from the lessor is dropped, and the lessor's alternative right of cancellation for his failure to do so is retained alone. The greater efficacy of the latter to restrain the lessee is undoubted. The lessor by the substitution has not weakened its control, but only rendered it less obtrusive.

(2) The *prohibitive use or tying clause* (characterized by the defendants as "the restricted use clause") provides that the lessee of a lasting machine (for example) shall not use the same on any welted shoes which have been or shall be welted "in whole or in part" by the aid of any welt sewing machinery not held under lease from the lessor, etc.

Notwithstanding the defendants throughout contrast the "independent" with the restricted leases, it is denied that this clause imposes any restrictions on the lessee. In support of this denial the somewhat surprising contention is made that the clause does not obligate the lessee to use either the leased machine or any other machines of the United Company at all. This truism applies equally to the restrictions dealt with in the Motion Picture Patents case (1917), 243 U.S. 502 (Mr. Justice Clarke), and its familiar antecedents. The lessee by the terms of the lease takes the machine for seventeen years. During that period he is responsible for its safe preservation, must insure it against loss by fire, pay the taxes assessed against it, bear the cost of its repair, and at the end of seventeen years return it to the lessor rehabilitated, and the return and transportation charges paid. These various obligations are predicated on the active use of the machine by the lessee or the leases must be placed outside the pale of business transactions.

It is further insisted that the lessor "grants" only a



"limited right" to use the machine and "reserves to itself" all other rights of use in that machine. But it borders on an occultation to say that the lessor has "granted" the right to use a particular specimen machine A, only with its other machine B, and has "reserved to itself" the right to use that same specimen A with some other machine, say C. For the use of a particular chattel is an inseparable incident of its possession in time and place. The lessee has exclusive possession of the specimen in his place of business for seventeen years. That granted, to say that the lessor has "reserved to itself" *any* right of use *in that specimen* within that seventeen years is to fling an impotent challenge to the unalterable constitution of time, space and matter. In connection with land the terminology of "grants" and "reservations" of the right of use may have a realizable meaning. The owner may grant an exclusive right to mine and use the coal underlying and reserve to himself the exclusive right to use and enjoy the surface of the soil. But the right to use (and, therefore, necessarily, to possess) a chattel cannot be subdivided or apportioned except in the category of time, for the reason that simultaneous possession (and, therefore, use) of it by two distinct and separate persons is inconceivable.

The argument struggled with takes on a superficial plausibleness by reason of the double negative employed in the clause. The stereotype form of the prohibitive use or tying clause affecting machines of a different type is as follows: The lessor's leased machine A shall *not* be used to perform operation X on any shoe as to which operation Y is or shall be performed by machine B, *not* leased from the lessor. It is just as true in this clause as it is in algebra, that two negatives equal a positive. Strike out the negatives (as we may without altering the meaning) and it is obvious that the lessee is under a positive con-

tractuàl obligation to use machine B, only in conjunction with A.

This is clear to a demonstration in a tabulation of the correlative rights of lessor and lessee in the leased machine.

LESSOR.	LESSEE.
Duty: to permit use of lessor's machine A to perform operation X only on a shoe as to which operation Y has been or shall be performed by lessor's machine B.	Right: to use lessor's machine A to perform operation X only on a shoe as to which operation Y has been or shall be performed by lessor's machine B.
Right: to have lessee refrain from using lessor's machine A to perform X on any shoe as to which Y has not been or shall not be performed by lessor's machine B.	Duty: to refrain from using A to perform X on any shoe as to which Y has not been or shall not be performed by lessor's machine B.

The lessee is under a *contractual* duty not to use a competitive equivalent of B and this duty correlates a *contractual* right in the lessor.

The principle of the prohibitive use or tying clause is availed of in varying forms and with different effects. The lessee has the right to use certain machines only with accessory materials such as tacks, wire, nails, eyelets, dies, etc., purchased exclusively from the lessor. Again, two machines A and B, performing respectively operations X and Y, are leased for a flat royalty of two cents (for example) for each machine as to each pair of shoes *with the proviso* that if the royalty on A for performing X is paid, that on B for performing Y shall be waived or vice versa. Here the prohibition is accomplished by doubling the royalty on one machine, if the lessee substitutes a

competitive equivalent for the other. There are other variations, but a volunteer may not risk wearying the court with tedious details. Moreover, it was once said: "In an instrument well drawn, as in a poem well composed, silence is sometimes most expressive." *Chisholm* v. *Georgia* (1793), 2 Dall. at 454 (Mr. Justice Wilson).

II.

The exclusive use clause:

In the category of a given type, excludes the use by the lessee of any competitive equivalent machine for seventeen years.

This clause (or its equivalent, the additional machinery clause) is the unit and fundamental restriction. It is likewise the oldest, having been employed in the industry long before the formation of the United Company. So long as specimens of only one type of machine are put out it is all sufficing; as an adjunct to the seventeen year term it is a perfect instrument of monopoly.

In leasing one or only a few specimens the lessor avails of the lessee's momentary dependency on it and by contract projects that dependency as an obligation over a period of seventeen years. At the outset the necessity of resorting to the lessor rests on a fact (*i. e.*, the lessor's exclusive control of the particular type of machine); after the execution of the lease, it rests on an obligation of the lessee extended over seventeen years, regardless of any change in the fact during that long period. To get the use of these only temporarily the lessee must obligate himself to continue that use for the period named. But this is a minor aspect of the matter.

The exclusive use clause obligates the lessee to acquire from the lessor exclusively all additional identical or equivalent specimens required throughout the seventeen years.

At the outset the lessee may require only two specimens; his business may so expand that at the end (say) of ten years he requires fifty additional ones. All these must come exclusively from the lessor under contracts which, from their respective dates, anew project the lessee's dependency seventeen years.

The lessee's temporary need for the use of one or a few specimens is not only as an obligation extended in the category of time seventeen years, but it is likewise simultaneously extended in the category of identical or equivalent specimens so as to embrace all additional machines of the character (however great the number may be) used throughout the period. Such additional machines are put out only on seventeen year leases, so that in the instance of a lessee whose business is expanding the exclusive use clause imports an endless prolongation and a progressive enlargement of the lessee's obligatory dependency on the lessor for the particular type involved. As to the lessee's future requirements for machines of that type competition is completely excluded notwithstanding that competitors may offer equivalents of superior efficiency at lower prices.

The superiority of a given mechanism is relative and lasts only for a brief time. Patents are no guarantee against competition, as the lessor admits when it avails of this clause. There can be no infringement without competition; but there can be (and frequently is) the most intense competition without infringement. The linotype and monotype printing machines, both protected by large numbers of patents, are to a large extent competitive equivalents, each a rival of the other. Automobiles of countless types infest the country like grasshoppers, and no doubt each separate competitive make embodies numerous patented inventions. It is only an accident of history that Morse and Marconi were not contemporaries.

The exclusive use clause in the category of a given type excludes the use by the lessee of any competitive equivalent specimen, whether old, newly invented, patented or unpatented, throughout seventeen years, at the least. It is designed and intended to insure the lessor for seventeen years against the deliberately expected and known imminent hazard of a better machine offered to the lessees on more favorable terms by a rival manufacture. It thoroughly executes the action signified by its name.

The full effect of this clause cannot be made clear until after its correlation is shown.

III.

The prohibitive use or tying clause:

Generalizes the effect of the exclusive use clause in the category of different types of machines (and their accessory materials, if any).

In advance of dealing with the situation that actually existed when the system of restrictions was imposed, let it be supposed that there are two different types of machines designated for the sake of brevity as Type 1 and Type 2. If Type 2 for the time being in its respective sphere is as dominant and as unvexed with competitive equivalents as Type 1, then the exclusive use clause will make the lessor's supply of Type 2 *coexclusive* with its supply of Type 1. On the other hand, if Type 2 is weaker (*i. e.*, in the face of competition) than Type 1, the exclusive use clause will not serve the purpose. (This is notoriously the circumstance in connection with the accessory materials.) The lessee of Type 1 would take a competitive substitute for Type 2 from another source, even though it be a poorer machine, rather than obligate his dependency on the lessor as respects Type 2 for seventeen years.

In this situation the lessor further avails of the lessee's

temporary dependency on it alone for Type 1 by inserting in the lease of that machine the prohibitive use or tying clause and thereby obligates the lessee to use Type 2 exclusively throughout the period. By the insertion of this clause competition as respects Type 2 (the weaker machine) is as completely excluded as it is with respect to Type 1. All subsequent specimens of Type 2 must likewise come exclusively from the lessor. For the lease of Type 1 contains the exclusive use clause and the prohibitive use clause provides that no machine of Type 1 shall be used on any shoe as to which the respective operation of Type 2 has not been or shall not be performed by a machine leased from the lessor. The prohibitive use clause as an adjunct to the exclusive use clause affects all specimens of Type 2. So that it is literally true to say that *that clause generalizes the effect of the exclusive use clause in the category of types embraced.*

The subtle but important fact in connection with the prohibitive use or tying clause is that for seventeen years it imparts to all the types of machines (and their accessory materials, if any) affected, the maximum strength of the strongest when in the apogee of its demand. If there is one type which temporarily is indispensable and as to which at the same time the lessees are dependent exclusively on the lessor, that indispensability in undiminished degree is infused for seventeen years into the weakest type correlated. The lessor's supply of nails, tacks, eyelets, etc., is rendered precisely *coexclusive* with its supply of its most strongly patented machine, when first offered. This chain that binds together new and old machines, patented and unpatented ones, and materials that are wholly open to the public, is as strong as its strongest link, that link taken at the point of time when its strength was at the maximum.

IV.

The exclusive use and prohibitive use clauses:

Each is an integral function of the other.

What the exclusive use clause is to all specimens of the particular type, the prohibitive use or tying clause is to the different types of machines (and the respective restricted materials) embraced. The exclusive use clause alone ties the use of the machines in the category of additional identical or equivalent specimens. If the leases contained only this clause (and it is a staple in the "independent" leases), then a rival machine manufacturer who could supply the shoe manufacturer with all the machines that he required of a given type could compete — provided he could find one who was not obligated as to that type for seventeen years. The prohibitive use clause ties the use of the machines in the category of the different types, it is omitted from the so-called "independent" leases, and the lessor by the initial payments exacted in connection with the omission has placed its own evaluation on the clause as a part of its system of restrictions. If the leases contained this clause only, then a rival who could supply additional equivalent specimens of any of the types could compete in the supply of such additional machines required in the course of time by the lessee.

But the two clauses combined and interacting, each being an integral function of the other, exclude competition even as to a single specimen of any and every type embraced by the two restrictions. To compete, a rival must come prepared to supply the shoe manufacturer with all types embraced by the prohibitive use clause and with all specimens embraced by the exclusive use clause. Even then he must wait at least seventeen years for the opportunity.

V.

The plan pursuant to which the machines and materials are integrated into the system.

The force and effect of each instance of these two restrictions in correlation, and the resultant effect of all the instances, combined and imposed with unequal incidences on the various machines and materials, are matters undeniably difficult of explanation. It may be helpful to begin with the simple and advance towards the complex. In *Chisholm* v. *Georgia* (1793), 2 Dall. at 431, Mr. Justice Iredell said: "I have often found a great deal of confusion to arise from taking too large a view at once."

The outstanding fact of the leasing system is *time values*. Privileges extending over a long period of time are sold in exchange for a price the payment of which is likewise extended. Since the length of time determines the amount of the price, the seller, aiming at the maximum return, fixes a long term and stops at seventeen years — the life of a patent — only because of a supposed legal obstacle to go further. The extended time of the lessee's obligation is the opportunity of the lessor. This is not to intimate a criticism of the leasing system as such; it is only by way of considering an abuse of it. In the instance here involved the seventeen year term serves as the warp in a restraint of which the restrictions are the woof.

Given a brief period of time when the lessee is dependent exclusively on the lessor for an indispensable type of machine, the lessor can transmute that dependency, resting then on a fact, into an obligation and, as such, project it in time beyond the period of the existence of the fact and broaden its scope so as to include many other

things. This is so, for the reason that the shoe manufacturer's need *for the time being*, if not irresistible, is commercially so pressing that it demands satisfaction then, even at the cost of projecting his momentary dependency on the lessor over a long period of years. It is only a truism to say that most necessities are such *in time*. A man stricken with tuberculosis must have the best remedy *then* existent. A better may come in the long run, but meanwhile, in the short run, he may perish. His necessity then and there may be such that, in order to avail of the best remedy then current, he will bind himself to take the same specific or others originating from the same source, exclusively for seventeen years. The factor that brings success or failure in the competitive struggle, is temporal; it changes with time. But a competitor, to survive, must have the best machine extant at any given time. He may get a better in the long run, but in the short run his rivals, who have the machine, will take the business and he will perish.

The compelling dependency of the shoe manufacturers on the lessor at the period of time when the system of restrictions was initiated is a fact established beyond controversy by the record. That dependency did not inhere in any overpowering efficiency or excellence of any particular type of machine. It was inevitably incident to the sudden fusion of the four principal concerns in the creation of the United Company. It is not disputed that these four concerns (viz., 1. Goodyear Shoe Machinery Co., 2. Consolidated and McKay Lasting Co., 3. McKay Shoe Machinery Co., and 4. Eppler Welt Machine Co.) taken together were the source of supply of very much the greater part of the machinery (as defined on the record) available in the country at the time. This is true as to the various then existing types of machines as well as to the aggregate number of specimens of any and all types. Outside of

these four, there was no existing source of supply commensurate with the requirements of the shoe manufacturers as a whole. A large shoe manufacturer for indispensable parts of his entire equipment was unavoidably dependent on the group, but his dependency was decentralized, multiplex and apportioned among the four (undoubtedly in unequal degrees). The pressure which any one could bring to bear in imposing conditions was partial.

That this was the situation, curiously enough, is vouched for by the defendants. They deny that there was competition among any two or more of the group and at the same time they predicate a justification of the restrictions on the assertion that three of the four concerns (the Eppler Company they say was not actually putting out machines), had long employed in their respective leases equivalents of the exclusive, and prohibitive, use clauses. The fact is doubly significant. It shows that these concerns had a practical monopoly within their respective spheres; negativing the existence of any considerable competition on the outside. It shows also that the shoe manufacturers were acutely dependent on each member of the group for that portion of his equipment exclusively supplied by such member.

At this point of time the focus of the lessee's mutual hope and of the machinery manufacturers' mutual fear, was precisely concentric; future competition among the members of the group, each breaking in upon the trade exclusively controlled by the others. For (to revert a sentence) the clauses mentioned when and wherever they occur are at once a signal of danger and a safety device; they attest the imminence of the competition which they exclude; and the reality of the danger is as certain as the efficacy of the device. Where they are, competition is not, but threatens to be.

The hope and the fear alike eventuated in the formation of the United Company. The shoe manufacturers hoped to have their manifold dependency on the group of concerns lifted by competition. The syndicators contrived successfully to centralize, accentuate, intensify and vastly prolong that dependency. From that moment forward the dependence of the shoe manufacturer on the lessor for his entire equipment (as by the record defined) was single and complete. *For the time being* there was no other source of supply; after a while competition might spring up, but meanwhile an equipment must be had on whatever terms obtainable. The United Company had to offer now, not a single machine which had no competitive equivalent whatever, but that which gave it for the time being infinitely more power in imposing conditions, to wit, the one complete equipment, no important part of which had a competitive equivalent whatever. The shoe manufacturers then and there were confronted with the alternative of using the machines on the conditions tendered, or practically going back to the awl, the bristle point and the peg. In the situation the lessor's power and the correlative dependency of the shoe manufacturers was unique in the history of the industry.

After syndicating the machines into a unit, the lessor likewise syndicated the restrictions into a system. The shoe manufacturer's dependency as respects several important types of machines for the moment was complete and rested on the fact that the lessor was then the exclusive source of supply for such types. The whole problem was to convert that dependency into a long time obligation and at the same time broaden that obligation so as to embrace machines and materials for the supply of which the lessees were in no wise dependent on the lessor. To do this the lessor took those types of machines its supply

of which (by reason of patents or otherwise), for the time being, was most absolute and on the right to use those machines grounded an obligation to use all the other machines and the accessory materials supplied by it exclusively for seventeen years.

There can be no dispute about the part played in the plan by the respective groups of machines. The lessor's plan and intent, the relative importance of each group of machines in the system, is dispersed in anagram in the lease clauses, as will now be shown. The leases of the strongly controlled groups of machines carry the exclusive use clause and the prohibitive use or tying clause, obligating the use of the weaker machines and the materials.

As an aid to imparting or acquiring a notion of the scope of the prohibitive use or tying clause as applied in the leases the chart or graphic printed as an exhibit to the petitioner's brief is of distinct value as indicating the eight groups under which the various machines are classified and the manner in which they are related by the prohibitive use clause. (The chart has been criticized by the defendants, but the only inaccuracies *of fact* suggested are, that the chart includes group 5 (pegging machines), the machines which are not used on welt or turn shoes, and that within the several groups there are *some* machines not tied as the chart would indicate. This is only to say that the chart is in the abstract and does not indicate all exceptions. Admitting the full import of the criticism the essential usefulness of the chart is not impaired. It does indicate the relations of the various groups, the most important machines in each of which are tied as indicated, and when considering only welt or turn shoes group 5 may easily be ignored.)

The great value of the chart is in the fact that it imparts completeness and diagrammatic vividness to one's

notion of the scope of the prohibitive use clause, and at the same time it exhibits the very great difficulty (and in the writer's case failure) of fully and accurately describing in words the precise mode of the restriction. Almost unavoidably one characterizes the restriction as tying together the use of two or more machines. This affords to the mind the image of two or more machines so bound together as to the right of use that one cannot be taken and others left. The chart shows that this is not necessarily true. Frequently the contractual ligature has strength in only one direction; the privilege of using machine A may obligate the use of B, but this may or may not obtain reversely. *The scheme in the main is one of non-reciprocal dependency.* The arrows on the chart indicate the dominant and servient relation of the groups, pointing *away* from the dominant and *towards* the servient. For example, in order to use *certain* of the machines in group 1, the lessee must use *certain* of the machines in groups 2, 6, 7, and 8, but of these only 6 is reversed. As extremes we have group 3 which is dominant to 2, 6, 7, and 8, though servient to none, and group 8 which is dominant to none though servient to 1, 2, 3, 4, 6, and 7. Intermediate is group 6 that is in both a dominant and servient relation.

The great difficulty of adequately describing or even retaining before the mind an idea of this peculiar and complicated inter-dependence affords the opportunity for the pertinacious dialectic of the defendants. One can deal in generalities only at the peril of having an exception pointed out and dilated upon at such length that the generality is plausibly emptied of even a partial truth. The non-reciprocal character of the dependency makes any general statement delusively inexact, for the adversary has only to select a machine (or group) serviently related by the restrictions to establish a destructive exception.

Thus one may not assert that in order to lease one important (or "essential") machine or group of machines of the lessor the lessee must lease all such machines embraced by the restrictions, for the lease pertaining to the Goodyear machines (group 8) contains no such provision, and those machines or their competitive equivalents are incontestably important or "essential". This one glaring instance of the non-reciprocal incidence of the restrictions is a staple of the defendants' argument. A weakness of the system of restrictions that was and is inevitable is relied upon to disprove its strength.

For the chart demonstrates that at the time the restrictions as pleaded were imposed the maximum degree of the exclusiveness of the lessor's control existed in connection with some of the machines in groups 1, 2, 3 or 4. All the machines and materials affected by the restrictions must be (commercially speaking) indispensable or "essential", otherwise they could not be marketed under such a burden. They differ only in the degree of the exclusiveness of the lessor's control at the period mentioned. The system of restrictions levels *this exclusiveness from zero upward to its maximum* and generalizes it at that maximum as to all the machines and materials affected.

The chart shows instantly what of the "essential" machines were in the highest degree within the exclusive control of the lessor and what ones were dangerously free from that control and to which a like degree of exclusiveness had to be contractually imparted from the other groups.

In point of imparting its exclusiveness to other groups or borrowing from others their exclusiveness:

Group 1 imparts to five and borrows from one.
" 2 " " four " " " three.
" 3 " " five " " " none.
" 4 " " four " " " none.

(We now drop to the distinctly debtor class).

Group 6 imparts to five and borrows from six.
" 7 " " two " " " six.
" 8 " " *none* " " " *six.*

Here then we have a stark and unqualified admission from the lessor as to what machines for the supply of which the lessees were in fact most completely dependent on it, and as to what others that dependency is created entirely by contract. Thus the lessee's dependency for some of the machines in group 3 *is by contract extended in undiminished degree to machines in five other groups.* The machines in those other five groups as respects a lessee who wants only group 3, are one hundred per cent parasitical. Bowing to the commercial necessity of availing of group 3 he is thereby obligated to take certain machines in the five groups related whether he desires them or not. Group 8, the Goodyear machines, stares at one like the empty eye socket of Polyphemus. The dependency of the lessee on the lessor for those machines is *entirely vicarious.* The lessor was so thoroughly frightened at its total lack of control of machines of this type that it imparted to them the lessee's dependency for certain machines in each and all groups 1, 2, 3, 4, 6, and 7 (group 5 is ignored, for the reason stated). The Goodyear machines are contractually forced upon every lessee who uses certain of the machines in any of the groups mentioned. The lessor to make sure of precluding competition as to these (the weakest group, correlated) tied them inversely to the greatest possible number of other machines. They are one hundred per cent borrowers in point of competitive strength. Apart from this borrowing the lessor's control of them would be zero. By the leases the lessor's control of the Goodyear machine is rendered *co-exclusive* (in point of time and number of

specimens) with its control of its most recent and strongest controlled type. Yet defendants have attempted to draw from this inevitable and obvious weakness of the lessor's control of the Goodyear machines a proof of the great freedom of the lessees. They might as well dilate upon the absence of a restriction on the right to use leather, eyelets, tacks or nails obtained from the lessor.

The entire plan of the restrictions then is this: The strongly controlled types carry the exclusive use clause. The prohibitive use clause generalizes the effect of this in the category of the weaker types. In this manner (to summarize) *the maximum exclusiveness of control particular to any indispensable type is by the restrictions invested in the lessor in like degree of exclusiveness as to every specimen of every type embraced.* Or phrased from the view point of the lessee: *the maximum degree of the lessee's dependency on the lessor for any particular type of machine, at a given point of time is, by the lessee, obligatorily assumed, in undiminished degree throughout seventeen years as respects every specimen machine (and its restricted material if any) of every type embraced.* Under the system of restrictions a little leaven of monopoly, monopolizes the whole restricted mass from the centre to the outermost periphery.

More than once in the printed argument the defendants have likened the various machines to component parts of one great machine and on the right to control any single part have argumentatively predicated the right to control the whole. The comparison is apt, but this machine is commercial and not mechanical. The co-ordination is contractual and not physical. It was not assembled in a factory, but in a lawyer's office. The main drive shaft is the prohibitive use clause; the strengthening ribs that sustain it against any shock of competition is the exclusive use clause. Standardization has been carried to a

hitherto unknown extreme of fixed rigidity; all the component parts and even the accessory materials for seventeen years must come exclusively from the original designer.

It is useless to cite authorities on the illegality of this system of restrictions. When closely examined these leases are a far more extreme and wider reaching restraint than can be found in any other case so far dealt with by this court, construing the Anti-Trust Act. Since the enormity of the restrictions is wholly unmatched by anything in the reported decisions, the latter are dull reading with the lease restrictions before one's eyes.

A word on the seventeen-year term alone will suffice, for this is the base of the whole superstructure. It has been pointed out that the temporary dependency of the lessees on the lessor is the occasion for the imposition of their contractual dependency. Under free competition the power of superlative merit, while such merit is superlative, is irresistible and is only another name for success. To infallibly secure the co-ordination between industrial rewards and this industrial merit, is the profound and momentous purpose of the Anti-Trust Act. But a mechanism that dominates the market today, on the advent of a superior two or three years hence, may be scrapped as junk. Suppose the manufacturers of buggies, wagons and drays seventeen years ago had placed all users thereof under contract to use those instrumentalities exclusively during seventeen years for the transportation (privately) of persons and freight. What room would there have been for the overwhelming superiority of the motor car? The intrinsic and ineradicable evil of the seventeen-year term of the leases is that it secures and maintains the maximum exclusive ascendancy for the lessor's machines long after those machines may (and in all probability have) become industrial anachronisms. But this is only one evil. For

the seventeen-year term is broadened so as to include all specimens and materials subsequently required, so that the history of the industry for seventeen years in the future was written seventeen years ago in the past.

VI.

The Cancellation Clause.

The cancellation clause incorporates all the lessee's several, isolated obligations into a single all embracing one, and to that imparts an irresistible sanction. All the lessee's separate dependencies on the lessor for all the machines and materials are aggregated into one indivisible and overpowering dependency.

This clause provides that if any breach or default shall be made in the observance of *any one* or more of the conditions "in this agreement contained or *contained in any other lease*" subsisting between the lessor and the lessee "and expressed to be obligatory upon the lessee", the lessor shall have the right "to terminate forthwith *any or all leases*" then in force between the lessor and the lessee, etc.

The manner of enforcing the provision is simple. The lessor cancels "forthwith" by giving a notice in writing, and the lessee grants to the lessor "full right, power and authority" upon such termination "to enter upon the premises and into" "any place where the leased machinery" may be and "take possession thereof and take away the same".

It is said that this provision does not occur in *all* the leases, but it does occur in at least *one* of the forms executed by every lessee, and that suffices to incorporate it into all. Again, it is said that the exclusive use provision does not come within the words "expressed to be obligatory upon the lessee", but then that clause carries with it

as one of its terms the right to cancel all leases in which it occurs. The two forms of the clause embrace the entire equipment leased.

No doubt the right of cancellation is unobjectionable in a normal contract and particularly so if it is mutual to both parties. There is no mutuality of obligation in the leases and the lessee has no right of cancellation for breach, for the simple reason that no conditions are assumed by the lessor. Defendants say the privilege is necessary to protect the lessor against acts of dishonesty or unfairness on the part of a lessee. But honesty and fairness are only the mint and anise of the lessee's obligation. He is bound to use all the lessor's restricted machines and materials exclusively for seventeen years. These comprise the whole of his bottoming equipment, without which all his other machines would be useless and his factory an idle and vain thing. Now "generally speaking, the measure of a condition is the consequence of a breach". *Motion Picture Patents Co. v. Universal Film Co.* (1917), 243 U.S. at 519 (Mr. Justice Holmes, *dissenting*). Tested by that standard, the hazard of forfeiting his bottoming equipment, and with it his entire manufacturing business, is the measure of each and every obligation imposed by the intricate net work of restrictions. The use of five pounds of eyelets or nails purchased from a competitor of the lessor gives the latter the absolute right to visit the lessee's business with a ruinous consequence comparable only to the devastation of a cyclone or a conflagration.

How then can the lessee obtain any relief from any of the restrictions? He can obtain no injunctive relief under the Anti-Trust Act, for that kind of relief may be had only at the instance of the Government. He cannot enjoin the cancellation in a State court, for he has in advance agreed to it as a term of the contract. To test the legality of the

restrictions in the courts, he must breach at least one or more to raise an issue. If he commits such a breach, long before the issue can be determined his business will have been ruined by the loss of his equipment.

The hazard of invoking judicial inquiry into the validity of the restrictions is so great as to render the privilege of making the attempt purely illusory. The State of Massachusetts, by a statute enacted in 1907 (Chap. 469 of the Acts and Resolves of Mass. 1907, page 419) (see Opinion of the Judges of the Supreme Court 1907, 193 Mass. 605) outlawed all these restrictions in that State with a detailed particularity that omits nothing to their identification, except the name of the United Company, and yet no lessee in Massachusetts has undergone the hazard of seeking his freedom from them in the courts of that State.

The penalty for violating the Sherman Act or the Massachusetts statute is a jail sentence or a fine or both. The penalty to the lessees for violating the terms imposed by the United Company is business ruin. The United Company has succeeded in giving to its self-imposed restrictions a more terrorizing sanction than either Federal or State Governments have attached to their respective anti-monopoly statutes. And the shoe manufacturers, confronted with the alternative of violating the law or violating the illegal impositions of the United Company, have weighed the consequences attached and chosen the former. To them a business burdened by illegal (and even criminal) restrictions to which they are unwilling parties, is to be preferred to no business at all.

The court has already dealt with a case on principle indistinguishable. In *Ex parte Young* (1907), 209 U. S. 123 (Mr. Justice Peckman) the facts were: The State of Minnesota had enacted a railway rate statute and affixed such severe penalties for its violation that the law was held void for that it deprived the railroads of the right to resort to

the courts to have their rights determined. Mr. Justice Peckham delivering the opinion of the court said (145–6):—

> "The company, in order to test the validity of the acts, must find some agent or employee to disobey them at the risk stated. The necessary effect and result of such legislation must be to preclude a resort to the courts (either state or Federal) for the purpose of testing its validity. The officers and employees could not be expected to disobey any of the provisions of the acts or orders at the risk of such fines and penalties being imposed upon them, in case the court should decide that the law was valid. The result would be a denial of any hearing to the company."

Later in the opinion he said (p. 147): "it may therefore be said that when the penalties for disobedience are by fines so enormous and imprisonment *so severe as to intimidate the company and its officers from resorting to the courts to test the validity of the legislation, the result is the same as if the law in terms prohibited the company from seeking judicial construction of laws which deeply affect its rights.*" (Italics mine.)

The situation of the shoe manufacturer is little better. He is not threatened with imprisonment, but he, too, in order to test the validity of the leases in the courts must disobey them at the risk of having his factory stripped of a large and indispensable part of his equipment (forced upon him by the United Company) and that means business disaster. If the Minnesota statute had omitted the imprisonment feature of the penalty, and provided for a forfeiture of all the rolling stock, the railroads then would have been placed in no worse situation than the lessees are now. In

either circumstance a sudden sequestration of equipment means a wholly irreparable destruction of the industry.

Clumsily screened by the derisive rhetoric of "the best machines made", "service free of charge", "independent leases", "delicately constructed machines adapted to work only in series or as a team", "wholesale prices for a group of machines" and "the poor man's equipment furnished without initial investment", this terrorizing deadfall, for eighteen years, has stood between the courts and a lessee seeking to invoke judicial inquiry into the validity of the restrictions, and among over one thousand lessees there is no reported instance of any single one having risked the incalculable consequence of releasing the trigger. In view of the enormity of the restrictions, this eighteen years unbroken unanimity of silence on the part of a thousand lessees, is as piercingly significant as the unheard groans of victims overwhelmed beneath the fallen roof of a mine.

Can it be that this corporation can thus immunize against judicial inquiry into their validity such contractual exactions (compelling practically all the shoe manufacturers of the United States to use the machinery of the defendant *to the exclusion of the machines of all others*) and thereby evade the provisions of the Anti-Trust Act, when a like prerogative, as respects a legislative enactment, has been denied by this court to one of the sovereign States of the Union?

VII.

Finally.

As usual in such cases the defendants much protest their good intentions and the absence of a purpose to restrain trade. But the leases in every paragraph expound the intent and proclaim the purpose. They are the defendants' advance confession of a premeditated and systematically worked out plan to exclude competition in the

business of manufacturing and selling shoe machinery. On the question of intent and purpose these provisions "are heavier than the mere breath of a witness". *Dalrymple* v. *Craig* (1899), 149 Mo. at 356 (Valiant, J.). The leases show not only what was intended, but what has actually been done, and "a party cannot avoid the legal consequences of his acts by protesting at the time he does them that he does not intend to subject himself to such consequences". *International Contracting Co.* v. *Lamont* (1894), 155 U. S. at 310 (Mr. Justice, now Chief Justice, White).

Moreover, a group of lessees have testified to their entire satisfaction with a system of restrictions that at the least for seventeen years precludes them from availing of a single competitive equivalent of the restricted machines regardless of its superiority or lowered royalty. But this also was to be expected.

The defendants since 1899 have possessed and exercised an unrestrained power over all the lessees. They have had favors in the nature of unobligated "service" and free bonuses to be awarded or withheld according to the behaviour of a lessee. Soft speech and unprompted obedience as the twin con-comitants of unrestrained power were old at the point where authentic history begins.

> "The Lion, the Ass, and the Fox went hunting together and it was agreed that whatever was taken should be shared between them. They caught a large fat Stag which the Lion ordered the Ass to divide. The Ass took a deal of pains to divide the Stag into three pieces, which should be as nearly equal as possible. The Lion, enraged with him for what he considered a want of proper respect for his quality, flew upon him and tore him to pieces. He then called on the Fox to divide. The Fox, nibbling

off a small portion for himself, left the rest for the Lion's share. The Lion, highly pleased with this mark of respect, asked the Fox where he had learned such politeness and good-breeding. 'To tell the truth, Sire', replied the Fox, 'I was taught it by the Ass that lies dead there'". (Aesop.)

In *Henry* v. *A. B. Dick Co.* (1912), 224 U. S. at 55, the Chief Justice, dissenting, said: "Take a patentee selling a patented engine. He will now have the right by contract to bring under the patent laws all contracts for coal or electrical energy used to afford power to work the machine or even the lubricants employed in its operation. Take a patented carpenter's plane. The power now exists in the patentee by contract to validly confine a carpenter purchasing one of the planes to the use of lumber sawed from trees grown on the land of a particular person, or sawed by a particular mill."

The illustrations given fall short of the reality with which the record confronts the Court.

Respectfully submitted,

FRANK Y. GLADNEY,
Amicus Curiæ.

No. 207.

THE UNITED STATES, *Appellant*,

v.

UNITED SHOE MACHINERY COMPANY, OF NEW JERSEY, ET AL., *Appellees*.

Appeal from the District Court of the United States for the District of Massachusetts.

SUMMARY OF BRIEF AND ARGUMENT ON BEHALF OF THE UNITED SHOE MACHINERY COMPANY, ET AL., APPELLEES.

PART ONE.

INTRODUCTORY AND GENERAL MATTERS.

The record in this case, though condensed, is so long, and the transactions involved so numerous and complicated, that the Brief and Argument for the Appellees is necessarily of considerable length.

The following Summary of the Brief and Argument has, therefore, been prepared for the assistance of the Court. It is not intended to take the place of the Brief, but to summarize the evidence and argument and thus aid the Court in reading the Brief itself.

I.

HISTORY OF THE CASE.

This is a direct appeal by the United States under the Expediting Act from a decree of the District Court for the District of Massachusetts dismissing the petition filed in this case.

The Court below which tried the case was composed of three judges of the first circuit—Judge Putnam, Judge Dodge, and Judge Brown (R. Vol. 1, pp. 1064, 1070).

All the testimony was given in open court under the new equity rules, with the exception of certain evidence relating to patents which was heard before a Special Examiner. The trial in open court occupied about eleven weeks.

All three judges rendered opinions, agreeing that the case was without merit, and that the petition should be dismissed.

In accordance with the opinions of the Court a decree was entered on May 14, 1915, dismissing the bill (R. Vol. 1, p. 1188).

The evidence taken in open court has been condensed and is contained in Vol. 1 of the Record. The evidence as to patents by direction of the Court was not condensed and is contained in Vol. 2 of the Record. The Exhibits are found in Vols. 3 to 5. There are also a large number of physical exhibits which could not be reproduced in the record.

II.

PARTIES DEFENDANT.

The petition having been dismissed as to nine corporate defendants prior to the taking of testimony, there remain 11 corporate defendants and 23 individual defendants (see Main Brief, pp. 3–5).

The United Shoe Machinery Company (hereinafter referred to as the "United Company"), a New Jersey corporation organized in 1899, is the principal defendant. It manufactures, leases, and sells certain types of patented shoe machinery and also supplies used by shoe manufacturers.

The United Shoe Machinery Corporation, a New Jersey corporation organized in 1905, owns the stock of the United Shoe Machinery Company. It is not an operating company and does not manufacture, sell, or lease shoe machinery.

The other corporate defendants are subsidiary companies and the United Company owns all or a majority of their stock. These subsidiary companies conduct minor departments of the United Company's business. For a statement of the business done by these subsidiary companies, see Main Brief, pp. 4–5.

None of these subsidiary companies competes with the United Company or with any other subsidiary company. Practically no evidence was introduced in re-

gard to them and they may be disregarded in the present case.

The individuals made defendants are or have been directors or officers of the United Company or its subsidiaries. As to most of these individuals no evidence was introduced except this fact.

III.

THE ALLEGATIONS OF THE PETITION.

The petition may be divided into several parts.

1. The Shoe Machinery Industry and the Situation existing in the Industry in 1899.

The petition alleges that the principal essential shoe machines are (R. Vol. 1, p. 991):—

(*a*) Lasting Machines.

(*b*) Welt Sewing and Outsole Stitching Machines.

(*c*) Heeling Machines.

(*d*) Metallic Fastening Machines.

Prior to 1899, it is alleged, the principal concerns engaged in the shoe machinery industry were:—

(*a*) The Goodyear Shoe Machinery Company (hereafter called the Goodyear Company), which itself and through its subsidiaries the International Goodyear Company and the Goodyear Company of Canada made 80 per cent. of the welt sewing and outsole stitching machines and 10 per cent. of the lasting machines used in the country;

(*b*) The Consolidated & McKay Lasting Machine Company (hereafter called the Consolidated Company), which made lasting machines and which owned the Davey Pegging Machine Company which made machines for attaching soles by wooden pegs;

(*c*) The McKay Shoe Machinery Company (hereafter called the McKay Company), which made metallic fastening machines and heeling machines; and

(*d*) The Eppler Welt Machine Company (hereafter called the Eppler Company), which itself and through its subsidiary the International Eppler Welt Machine Company made welt sewing and outsole stitching machines.

These companies, it is alleged, were in 1899 manufacturing their machines under patents. It is further alleged that many of the basic patents were about to expire and the lawful monopoly of such machines would have shortly come to an end (R. Vol. 1, pp. 992–3).

2. Unlawful Plan Charged.

The petition next alleges that certain of the individual defendants, being owners and officers of the above-named companies, not satisfied with the lawful monopolies which they held under their patents, and intending unlawfully to extend the patent rights held by them and to use the same as the means for unlawfully controlling interstate and foreign commerce in shoe machinery, determined to acquire a complete monopoly of the manufacture, sale, and lease of shoe machinery, to destroy existing competition in such machinery, and to exclude all others from such trade.

They therefore conceived the following plan (R. Vol. 1, p. 994), namely:—

(1) To acquire

> "the ownership or control of all concerns engaged in manufacturing and dealing in any and all kinds of shoe machinery";

and

(2) Having done so,—

> "to refuse to sell or lease any of the essential machines to the manufacturer of shoes except on condition that he buy or lease of them practically all other machinery of

whatever kind necessary or useful to such manufacturer of shoes,"

and thereby to exclude all competition in shoe machinery and to monopolize the trade therein.

3. Steps in Carrying Out the Foregoing Plan.

The petition next charges that certain acts described in the petition were done "in carrying out the above-mentioned unlawful project" (R. Vol. 1, p. 994). These acts may be summarized as follows:—

Formation of the United Company.

The defendants in February, 1899, formed the United Company, which took over the business of the Goodyear Company (and the International Goodyear Company which it controlled), the Consolidated Company, and the McKay Company in exchange for stock and cash at values far in excess of their real worth. Certain stock, it is alleged, was also issued for cash at par, which was used, among other things, to purchase the stock and business of the Eppler Company, its subsidiary the International Eppler Company, and also the Goodyear Company of Canada. It is alleged the defendants thus acquired control of the greater portion of the trade and commerce in the machines above described, to wit, Welt Sewing and Outsole Stitching Machines, Lasting, Heeling, and Metallic Fastening Machines (R. Vol. 1, pp. 995–996).

Leases of Machines.

It is alleged that the defendants thereupon discontinued the sale of machines and adopted arbitrary lease and license

agreements containing provisions not found in previous leases (R. Vol. 1, p. 997). These provisions, it is alleged in the conclusion of the petition (R. Vol. 1, p. 1028), are unlawful in that they exact unlawful covenants and conditions on the part of the lessee requiring him to use machines leased from the United Company of all kinds exclusively, providing that if these covenants are violated the lessee shall forfeit all his machines, and requiring him to use the leased machines for seventeen years.

Acquisitions of Other Concerns.

It is alleged that the defendants, in pursuance of their purpose to monopolize the shoe machinery industry, have acquired about 59 different competing concerns. Particular stress is laid on the purchase of the inventions of Thomas G. Plant made in September, 1910, more than eleven years after the formation of the United Company (R. Vol. 1, pp. 999–1023).

Covenants Taken from Vendors and Inventors.

It is alleged that the defendants took from the vendors covenants not to engage in business for long terms of years in competition with the defendants and to assign future inventions they might make or own (R. Vol. 1, p. 1000).

Other Monopolistic Acts.

The petition charges that the defendants have by threats induced customers to desert competitors; have offered rebates to shoe manufacturers dealing with them exclusively; have threatened competitors; have bought patents and

not used them; and "have done many other unlawful acts, too numerous to here set forth in detail" (R. Vol. 1, p. 999).

4. Profits.

It is alleged that the United Company has made excessive profits (R. Vol. 1, p. 1026).

5. Monopoly Acquired.

It is finally alleged that the defendants have by the above means acquired an unlawful monopoly of shoe machinery (R. Vol. 1, p. 1027).

6. Relief Asked.

A variety of relief is asked for, the principal relief requested being, (*a*) that the United Company be dissolved, and (*b*) that the provisions in the leases complained of be declared illegal and that the United Company be enjoined from enforcing them (R. Vol. 1, pp. 1029–1032).

ATTEMPT OF THE UNITED STATES TO LIMIT THE CHARGE MADE IN THE PETITION.

The petition, as shown above, charges that the defendants planned to monopolize all shoe machinery and also charges the monopolization of all shoe machinery in pursuance thereof.

During the course of the trial it developed that the United Company did not manufacture, and had never

attempted to manufacture, or acquire concerns for manufacturing certain important classes of shoe machinery comprising about half the machines used in the ordinary shoe factory, such as a variety of machines used in sewing the uppers of shoes, and further that there were numerous manufacturers of various machines of the kinds furnished by the United Company. The United States, therefore, admitted of record that it only charged a plan to obtain a monopoly, and a monopoly acquired in certain limited classes of machinery, viz., machines for preparing and attaching the bottoms to the uppers of shoes, eyeletting machines, and clicking machines. An amendment so limiting the petition was presented just before the close of the case but was not allowed.

This attempt to limit its case accentuates the complete failure of the United States to prove its charge as made by the petition and its attempt to succeed by making a different case. The case was tried on the theory that an attempt to monopolize and a monopoly of all shoe machinery was charged. The limitation of the charge to certain limited classes of shoe machinery is a material variance.

For a fuller statement of this attempt to limit and to vary the charge made by the petition, see our Main Brief, pp. 11–15.

IV.

THE ISSUE IN THE PRESENT CASE.

The issue presented in the District Court was whether the defendants formed a plan, as charged in the petition: (1) To acquire all concerns engaged in manufacturing shoe machinery, or (if the limitation insisted on by the United States be accepted) to acquire all concerns engaged in manufacturing certain specified classes of shoe machinery; and (2) thereupon to refuse to lease any essential machines unless the shoe manufacturer took practically all his other machines from them. And if they did form such a plan, whether or not such plan was unlawful, and whether they carried out the plan and thereby acquired an unlawful monopoly.

At the trial in the District Court there was no attempt to show the adoption of any such unlawful plan by direct evidence. The United States for proof of the plan relied entirely upon various transactions which it alleged were undertaken in pursuance thereof.

The District Court held that the various transactions justified no inference of any such unlawful plan or of any other unlawful plan; that they were normal lawful transactions; and that no unlawful monopoly was acquired thereby. This conclusion necessarily followed from the various facts found by the District Court. Accepting these facts, we submit no doubtful question of law is raised.

The case below was heard in open court. Practically all the evidence introduced by the United States came from hostile witnesses whose testimony was disputed. It comes before this Court in condensed form (see Main Brief, pp. 38–42).

In accordance with the well-recognized rule applicable in such cases the findings of fact made by the District Court should be accepted if they find any support in the record.

In *Adamson* v. *Gilliland*, 242 U. S. 350, a patent case heard by the District Court on oral testimony, the practical rule was said by the Court to be,—

> ". . . that so far as the finding of the master or judge who saw the witnesses 'depends upon conflicting testimony, or upon the credibility of witnesses, or *so far as there is any testimony consistent with the finding, it must be treated as unassailable*'" (italics ours).

For additional authorities on this point, see Main Brief, pp. 33–37.

This rule is especially applicable in a case like the present in which the question of intent is of primary importance and which involves such a large number of different transactions and such a vast amount of testimony. The officials of the United Company testified in open court for weeks and explained fully their motives and purposes, and the District Court which saw and heard them is the best judge of their character and credibility. Furthermore, the District Court took evidence in open court for nearly three months and examined hundreds of transactions involving the entire business life of the company. Their findings of fact as to the purposes and intent of the defendants, and

the effect of their transactions made after such exhaustive study should not be disturbed unless this Court is convinced that they cannot be sustained (see Main Brief, pp. 38–42).

The primary issue before this Court, therefore, is whether the findings of fact made by the District Court find any support in the record. Unless manifestly wrong they should be accepted, and if accepted they dispose of the present case. If this Court determines that the District Court's findings are manifestly wrong, then and then only it will be necessary for this Court to determine the true facts and to apply the law thereto.

V.

FINDINGS OF FACT BY THE DISTRICT COURT.

The more important facts found by the District Court are quoted in our Main Brief, pp. 44–70. We shall summarize them here.

The District Court found, among other things, as follows:—

1. Findings as to Alleged Unlawful Plan formed by the Defendants.

The District Court found that the defendants did not plan to acquire all concerns engaged in the shoe machinery business, as alleged in the petition, nor all machines for attaching the bottoms to the uppers of shoes, to which classes of machines the United States attempted to limit its charge during the course of the trial (see Main Brief, pp. 44–45).

The District Court found that the defendants did not plan to refuse to sell essential machines except on condition that practically all other machines were taken from them (see Main Brief, p. 45).

The District Court thus found that the defendants never formed the unlawful plan charged in the petition.

The District Court further found that the evidence failed to afford "any support for the alleged charges in the bill of

intended oppression, arbitrary conduct, or anything of that nature" (see Main Brief, pp. 65–66).

The foregoing general findings, we submit, dispose of the petition. But the District Court went further, and, considering the various transactions complained of separately and their effect, found that none of them was unlawful or shown to have been carried out with unlawful purpose, and they thus disposed of any possible charge whether or not made by the petition which could be based upon these transactions.

2. Findings as to Formation of the United Company.

The District Court found that the defendants' basic patents were not about to expire in 1899, and that this was, therefore, not a motive for the formation of the United Company. The evidence so completely refuted this charge that the United States has abandoned it (see *infra*, pp. 73–74; see also Main Brief, pp. 48–49).

The District Court found that the constituent companies which were consolidated into the United Company were dealing, with slight and immaterial exceptions, in distinct non-competing lines of machinery; that the purpose of the consolidation of these companies into the United Company was not to eliminate competition; and that such competition, if any existed between them, was not significant enough to make their consolidation unlawful (see Main Brief, pp. 45–48). It also found that the constituent companies were not taken over at excessive prices as alleged (see Main Brief, p. 49).

3. Findings as to the Leases.

The District Court found that the leasing system was of great benefit to shoe manufacturers (see Main Brief, p. 50).

It found that the United Company did not discontinue the sale of machines as alleged. None of the constituent companies had ever sold machines (see Main Brief, p. 50).

> "An attempt to support this charge by evidence wholly failed. Nothing of the kind was done nor is it easy to see what grounds for making the charge could ever have been supposed to exist" (R. Vol. 1, p. 1153).

The District Court found that the evidence completely refuted any charge that the United Company by its leases compelled shoe manufacturers taking machines previously furnished by one of the constituent companies to take other machines which had been put out by one or more of the other constituent companies and that the United Company was entitled to a full clearance from this charge (see Main Brief, pp. 51–52).

The District Court found that the provisions in the leases adopted by the United Company were not adopted for the purpose of excluding competitors' machines but were

> "obviously prompted by the purpose of developing the company's business"

through the perfectly legitimate method of offering them "on terms more advantageous to users" (R. Vol. 1, p. 1159).

The Court said (R. Vol. 1, p. 1159):—

> "Modifications in the contracts offered them tending, as these are shown to have done, to enable the company,

through provisions adapted to increase the number of shoes worked on by each machine, to lessen the royalty charged per pair, and to diminish or dispense with the initial payment before required, were so obviously prompted by the purpose of developing the company's business through the perfectly legitimate method of offering them on terms more advantageous to users, that it would be unjust to treat them, on evidence no stronger than that here presented, as really intended to accomplish an arbitrary exclusion of users from any dealings with others."

The District Court found that not only were the provisions adopted for a legitimate purpose but that they were not inherently unlawful apart from unlawful intention as they did not accomplish any unlawful restraint (see Main Brief, pp. 52–54).

The District Court further found that the defendants' success was due not in any substantial degree to the provisions complained of in the leases. It was due to the merits of the United Company's patented machines (see Main Brief, p. 55).

As to the allegations that the United Company oppressed its lessees by requiring them to pay exorbitant charges for repair parts and unreasonable return charges on leased machines the District Court found that there was no evidence to justify these charges. It said:—

"The evidence failed to show that lessees from the United Company had ever been compelled to pay exorbitant charges for repair parts, etc., or to pay any unreasonable return charges on leased machines" (R. Vol. 1, p. 1155).

4. Findings as to Acquisitions.

With reference to the acquisitions the District Court treated separately from the other cases the acquisition of the patents and inventions of Thomas G. Plant in 1910, on which great stress was laid by the United States.

In considering the other alleged acquisitions, which were mostly of slight importance, the District Court eliminated a large number of them from consideration because they involved:—

(*a*) The acquisition of concerns which were not engaged in furnishing shoe machinery at all, but were making or dealing in supplies such as sandpaper, patent brushes, pegwood, wire, treeing machines, needles, awls and rawhide mallets, nails and tacks, cement, blacking, metallic heels and counters and eyelets; or

(*b*) Machines or inventions for use with uppers, as to which no monopoly is charged; or

(*c*) Mere employment contracts or contracts to commute existing obligations not involving the acquisition of any business, machinery, or patents (R. Vol. 1, pp. 1138–1139).

As to the remaining instances which related to the acquisition of patent rights, patents, or machines "capable of being included within some of those kinds of shoe machinery" (R. Vol. 1, p. 1139) to which the case relates, the District Court found that as to the larger portion the acquisition was not of a competing machine or device, but, on the contrary, the acquisition was of a machine or device "of a kind not then being produced by the United

Company" (R. Vol. 1, p. 1139). As to the comparatively few remaining acquisitions, it appeared that the United Company

> "was at the time producing or trying to develop for production a patented machine for doing work more or less similar to that for which the invention of the machine acquired was intended" (R. Vol. 1, p. 1139).

The District Court found that in all such cases

> " . . . it appears that the acquisitions made were of patented improvements, whether or not embodied in an actual machine, enabling the United Company to increase the efficiency of its own machines, or to complete the development of others with which it was then experimenting or had not yet succeeding[ed] in rendering commercially successful.
>
> "No case, however, is found among the acquisitions of the character last descr bed wherein it has fairly been made to appear that actual competition existed between the device or machine acquired and any machine then being produced or experimented with by the United Company, of such consequence as justifies either the conclusion that the acquisition was for the purpose of suppressing such competition, or the conclusion that a material restraint of trade was thereby accomplished" (R. Vol. 1, pp. 1139–1140).

The Court further found that in most of these cases the vendor or the United Company claimed infringement which was settled by the acquisition (R. Vol. 1, p. 1140).

The Court further found that these acquisitions were

> "in importance and amount, only of a consequence relatively small in proportion to the entire field then lawfully belonging to the United Company.
>
> "It does not appear that they contributed anything essentially important to that degree of commercial suc-

> cess obtained by the company as above. If they assisted in obtaining it, it was by assisting the development of the machines to whose ultimate efficiency it was due. It can hardly be said as to any of them that they afforded anything more than a basis whereon to build. Speaking of them generally, it may be said that the invention or machine obtained required further development in the company's hands before it could be properly used" (R. Vol. 1, p. 1140).

The Court further found that during the same period the United Company refused to purchase concerns and inventions much more numerous than those purchased (R. Vol. 1, p. 1141).

The District Court further found that the acquisitions were not made at excessive prices and that this was not even insisted on by the United States in argument (see Main Brief, p. 62).

5. Findings as to the Purchase of Plant's Patents and Inventions.

The United Company in 1910 acquired many valuable inventions from Thomas G. Plant, and much stress is laid on this acquisition by the United States, apparently as showing that an unlawful purpose existed from 1899, the date of the formation of the United Company.

The District Court's findings completely refute the contentions of the United States. It found that Plant was not

> "a competitor in the ordinary sense. He was not carrying on any going business in shoe machinery. He was neither producing his machines nor supplying them to users upon any commercial scale, nor was he prepared so

to supply them, though he had issued an illustrated catalogue of them" (R. Vol. 1, p. 1142).

It found that the evidence

> " . . . sufficiently proves that they [the negotiations for the purchase] were never sought by the defendants and that there was never any attempt on their part to get Plant to sell them his inventions or machines or anything else; but that, on the contrary, all the efforts toward such a purchase were made by him" (R. Vol. 1, p. 1143).

The Court further found that the Plant machines embodying his inventions were not commercially successful, or capable of profitable use in their then stage of development (see Main Brief, pp. 59–60).

The Court found that the purchase was not made to escape competition. The reasons for the purchase were found to be the value of the Plant patents

> "used as they [the defendants] only could have used them in further developing and perfecting the machines they were then producing or trying to produce" (R. Vol. 1, p. 1145);

and the relief of the United Company from a vast amount of pending litigation and controversy (R. Vol. 1, p. 1145).

The inventions were found to be worth the price paid for them (R. Vol. 1, p. 1145).

The Court said:—

> "The above reasons, none of them open to any charge of illegality, seem to me to have been the really operative reasons which must have induced the defendants to enter into the Plant bargain upon the terms which he finally offered them. They appear so adequate as legitimate

business reasons for doing this as in my opinion to leave no reasonable ground for holding, against the defendants' denial, that it was really a purchase to suppress competition" (R. Vol. 1, pp. 1145–1146).

6. Finding as to Covenants taken from Vendors.

The Court found that the covenants taken from vendors showed no unlawful purpose; that they were framed in each case according "to the circumstances of the particular transaction;" and that it was not proved that any of them exceeded what the law permits (see Main Brief, pp. 62–63).

7. Findings as to Other Unfair, Monopolistic or Oppressive Acts.

The District Court acquitted the defendants entirely of these charges, holding that, in spite of "efforts which may fairly be described as extraordinary" to introduce every act or word of the defendants which might lend color to these charges, the results were so insignificant that the conclusion seems justified that the policy and methods of the defendants were in general "above reproach in any of these respects" (see Main Brief, pp. 63–64).

8. Finding as to Profits.

The District Court found that the United Company's profits were not shown to be unreasonable or excessive or its charges for machines exorbitant (see Main Brief, p. 64).

9. Findings as to Monopoly.

The District Court found that the United Company had no unlawful monopoly of all machinery and the United States, as we have stated, abandoned this charge (see Main Brief, p. 66). The Court further found that the defendants had no monopoly of machines for attaching the bottoms to the uppers of shoes as to which classes of machines the United States limited its charge. The Court said:—

> "In that part of the field of trade in shoe machinery to which the case is now limited as above, the defendants have been not monopolists but competitors. Their only means for holding the field have been legitimate means—better machines. *Their specialization in machines for bottoming shoes, and not a monopoly of such machines, has been the cause of their success*" (italics ours) (R. Vol. 1, p. 1135).

The Court further found that the defendants' success was due to the merits of their patented machines and the service they rendered users of the machines. Thus the various transactions criticised by the United States, since they were not the cause of the amount of business done by the defendants, become immaterial.

The District Court said:—

> "It is impossible to believe that the defendants' equipment is in so many shoe factories for any other substantial reason than the merits of what they have had to offer" (R. Vol. 1, p. 1187).
>
> "Nor can I regard the case as one in which any presumption arises, from the fact that so large a proportion of the users of these machines use the defendants'—that the defendants have committed any of the above forbid-

den acts in accomplishing the above result. The proof is too complete that it has been in fact reached by the use of methods entirely lawful, the leading features whereof are below indicated" (R. Vol. 1, p. 1136) (see also Main Brief, pp. 67–70).

The Court, after referring to the United Company's patents and improvements, the service it has rendered users of its machines, and the standardization of the parts of its machines, added:—

"That the degree of success attained and the preponderance in number of users supplied which the United Company has secured are fully accounted for by the superior efficiency it has developed in its patented machines for work in combination with each other, together with the superior facilities it affords as above for their most efficient use, must be regarded as shown beyond question" (R. Vol. 1, p. 1137) (see also Main Brief, pp. 67-70).

VI.

THE PRESENT CASE IS UNIQUE IN SEVERAL RESPECTS.

The present case differs materially from any case heretofore presented to this Court with the exception of *United States* v. *Winslow*, 227 U. S. 202, in which the formation of the United Company was held lawful.

In the first place, the United Company's machines were created under and are strongly protected by patents, are superior to any other machines made, and, as the District Court found, represent "the highest development ever reached in the art to which they belong" (R. Vol. 1, p. 1137). There is a natural presumption that a concern which furnishes the best machines made, which are patented, and which therefore cannot be manufactured by anyone else, should lawfully have a large portion or all of the business in machines of this character, just as the Bell Telephone Company, due to its patents, has furnished practically all the telephones in use.

Another unique characteristic of the present case is that no previous competition was eliminated by the United Company. Its constituent companies, except for a slight incidental overlapping of the field of one or two machines out of a large number, dealt in distinct non-competing machines. These machines were patented and were the best made, and therefore at the time of the formation of the United Company there were, for practical purposes, as the

United States alleges in its petition and now admits, no competitors in the field.

The United Company, therefore, did not enter a field in which competition existed and eliminate such competition. It entered a field in which, due to lawful patent monopolies of its constituent companies, there was, as a practical matter, no competition to eliminate. The machines as to which monopoly is charged are the same machines of which the constituent companies had lawful patent monopolies, but developed to an extraordinary degree of efficiency by a multitude of new inventions which are the subject of many new and now existing patents, and certain new patented machines invented or developed by the United Company since its formation.

PART TWO.

FACTS AND ARGUMENT.

I.

SPECIAL CHARACTERISTICS OF THE SHOE MACHINERY INDUSTRY.

The shoe machinery industry has special characteristics which differentiate it strikingly from any other industry in the country. These characteristics existed when the United Company was formed, and its methods of business were necessarily adapted to meet them. In considering whether the defendants' methods were "usual," "normal," and "orderly," whether they were entered into "with the legitimate purpose of reasonably forwarding personal interest and developing trade," or "on the contrary were of such a character as to give rise to the inference or presumption that they had been entered into or done" with unlawful intent (*Standard Oil Case*, 221 U. S. 1, 58), it is essential to bear constantly in mind the particular conditions with which the defendants dealt. The test in the present case is not what would be normal, reasonable, and legitimate in the tobacco or cotton goods business, but solely what was normal, reasonable, and legitimate in dealing with the conditions peculiar to the shoe machinery industry.

Some of the most striking characteristics of the shoe machinery industry are as follows:—

1. A great variety of different machines are used in the manufacture of each shoe. Thus on certain classes of shoes over 100 different operations are performed by different machines (Defs.' Ex. 235, R. Vol. 5, pp. 531–671).

There is also a great variety of types of shoes made, such as the McKay sewed shoe, in which the upper is united to the sole by a seam running through both outsole and insole inside the shoe; the welt shoe, in which a narrow strip of welt is attached to the upper and insole, and the outsole then attached to the welt so that the foot does not rest on the seams which attach the sole; the turn shoe, which has a single sole to which the upper is sewed while the shoe is inside out, the shoe being then turned during the process of manufacture; the pegged shoe, in which the sole is attached by wooden pegs; the nailed shoe, in which it is attached by nails; the standard screw shoe, in which it is attached by screws; and also various modifications of these types, such as the mock welt. Each type of shoe requires to a certain extent different machines.

The result is that a great variety of machines are required in the shoe trade. The United Company, which has specialized in bottoming machines and which does not manufacture any machines for sewing the uppers of shoes, and which manufactures and furnishes only from 30 per cent. to 50 per cent. of the total number of machines used in the ordinary factory (see Main Brief, pp. 602–605), nevertheless makes over 300 different kinds of machines.

2. The shoe machinery business, as stated above, is of recent origin. The industry, being entirely the result of inventions, has been dominated by patents. While machines of the kind in use seventeen or more years ago, on

which the patents have expired, can now be manufactured by any one, there is no demand for such machines. The later improvements have been so remarkable and have increased the efficiency and capacity of the machines to such an extent and effected such increased savings in the manufacture of shoes that it would not pay a shoe manufacturer to use unpatented machines of the type in use twenty years ago, even if he obtained them free. To find a market for his machines and to compete on equal terms a shoe machinery manufacturer must have machines embodying new inventions which make his machines as efficient as those of the latest type.

3. From the very beginning of the industry all of the principal shoe machines have been leased and not sold, the lessor depending for his return on a royalty of a certain specified sum for each pair of shoes on which the leased machine was used. Originally an initial payment was also charged to cover the cost of installing the machines and instructing operatives, but this has since been largely eliminated by the United Company.

Under this lease system the entire industry of manufacturing shoes by machinery was created and developed. It was the system under which the constituent companies furnished all their machines, at the time the United Company was formed. It had been adopted because it was found most satisfactory to the shoe manufacturer, and best adapted to increase the use of the machines, and, consequently, the return to the shoe machinery manufacturer; in other words, because it was best suited to the conditions of this particular industry.

For a full statement of the reasons for the adoption of the lease system, see Main Brief, pp. 248–253.

4. Bottoming Machines are extremely delicate and have many moving parts which easily get out of adjustment, thus either stopping the use of the machines, delaying their operation or causing poor work. Furthermore, the moving parts frequently wear out or need replacement. It is thus essential to the continuous and efficient operation of such machines that a stock of repair parts be near at hand to replace broken and worn parts and, owing to the delicate character of the machines, it is further essential that the shoe manufacturer should be able to obtain the frequent services of skilled mechanics thoroughly acquainted with the machines in order to repair them and maintain them in efficient condition. If such parts and service are not immediately available when a machine breaks down or gets out of adjustment, imperfect work results or the machine cannot be used at all.

The importance of maintaining the machines in efficient condition is multiplied many fold by the fact that a number of different machines are used in the manufacture of each shoe. The work in the shoe factory is planned to travel from one room to another in fixed quantities. A certain number of pairs of shoes are started each day and an equal number are finished each day. There is a regular flow of shoes through the factory from one machine to another. No large number of shoes are kept prepared ready for the operation of each machine. To do so would necessitate having a large amount of capital invested in material and lasts and would require too much space to store the partially prepared shoes. Furthermore, shoes in process of manufacture must be in "temper," that is, the soles and heels must be artificially moistened. Once in "temper" the shoe must be completed as rapidly as possible.

When one machine breaks down, it, therefore, not only stops the work on that particular machine, but it stops the work on the entire line or series of machines of which that particular machine forms a part (see Main Brief, pp. 334–338).

The daily capacity of many of the important machines is very large, some of them having a production of over 1,200 pairs per day. As most shoe factories have a comparatively small production, many, if not most of them, require only one machine of certain kinds (see Main Brief, p. 173). If one of these machines breaks down, it stops the entire production of the factory. All of the operatives are thrown out of work and the income of those companies which have leased machines on a royalty basis ceases until such machine is repaired.

Furthermore, the machines have been constantly improved and thereby changed and new machines invented, and it is essential to their effective operation that operatives be instructed by the manufacturer of the machines as to their proper use.

Shoe manufacturing is carried on to a large extent by small manufacturers. They cannot afford to keep skilled mechanics to repair their machines and instruct operatives in the use of the machines, nor can they afford to maintain a stock of extra parts. Even the large shoe manufacturers cannot furnish such service for themselves effectively and without undue cost. The manufacturer of the machines who can provide such service for a large number of factories can alone furnish it economically and efficiently.

II.

FORMATION OF THE UNITED COMPANY.

Our first inquiry is whether the formation of the United Company affords evidence of the unlawful plan charged in the petition or was a step in carrying it out.

We do not understand that the United States denies that there were substantial business reasons for the formation of the United Company, or that it denies that these legitimate business reasons were motives for the formation of the company. We understand their contention to be that there was competition between certain of the constituent companies, and that the elimination of this competition was also a motive for the formation of the company or made it inherently unlawful.

The United Company was organized in February, 1899, to take over the business of the Goodyear Company, the Consolidated Company and the McKay Company.

Each of these three companies occupied a special field of its own which it had created and developed under its patents. The machines of each company were used for different purposes and therefore did not compete. No other person had invented equally good machines and each of these companies, therefore, was furnishing practically all the machines of the kinds it manufactured which were used in the country (see Main Brief, pp. 84–89).

1. BUSINESS DONE BY THE CONSTITUENT COMPANIES.

A. Business of the Goodyear Company.

The Goodyear Company manufactured and leased patented machines for attaching the welt to the upper and the outsole to the welt of Goodyear welt shoes. It had two principal machines—the Goodyear Welt and Turn Machine (called the welter) for attaching the welt to the upper, and the Goodyear Outsole Rapid Lockstitch Machine (the stitcher) for attaching the outsole to the welt. The welter was used also in the manufacture of Goodyear turn shoes. The Goodyear Company had also thirteen auxiliary machines used in preparing the work for the welter and stitcher or in finishing it in certain details after the operation of the welter and stitcher, and three auxiliary machines similarly used in connection with its welter in the manufacture of Goodyear turn shoes (see Main Brief, p. 85).

The manufacture of the foregoing machines constituted the principal business of the Goodyear Company.

The Goodyear welt shoe was a better grade of shoe than the McKay, pegged, or standard screw shoes, which were the classes of shoes generally made by machines, but the Goodyear welt shoe was more expensive to manufacture. It gradually proved its merit, but in 1899 only 22,700,000 pairs of welt shoes were made out of a total production in the country of 172,786,000 pairs of shoes of all kinds, of which practically half were McKays. In 1898 only about 17,000,000 pairs of welt shoes were made. About an equal number of turn shoes were made in that year. The Good-

year Company, therefore, occupied a comparatively limited and special field which it had itself created and which it lawfully controlled by reason of its patents.

The Goodyear Company also manufactured and leased the Ideal Lasting Machine. This machine was designed and adapted for lasting women's welt shoes, which no other machine in the market could do successfully. It was not adapted for lasting men's welt shoes. The manufacture of this machine was an insignificant part of the Goodyear Company's business. Only .77 of 1 per cent. of the shoes lasted on machines in 1899 were lasted on the Ideal. Most women's welt shoes were at that time lasted by hand.

For a more complete statement of the business done by the Goodyear Company, see our Main Brief, pp. 84–86.

B. Business of the Consolidated Company.

This company manufactured and leased three kinds of patented lasting machines; namely, the Chase, the McKay & Copeland, and the Hand Method McKay Machine.

The Chase Machine was adapted to and developed for lasting men's welt shoes (R. Vol. 1, p. 397, lines 39–40).

The McKay & Copeland Machine was commercially adapted only for lasting heavy brogans (R. Vol. 1, p. 399, lines 13–14), that is, very heavy coarse shoes (R. Vol. 1, p. 397, line 14).

The Hand Method McKay Machine was designed and adapted for lasting McKay sewed shoes (R. Vol. 1, p. 399, line 22). It could not be used for lasting welt shoes (R. Vol. 1, pp. 399–400).

The Consolidated Company in 1899 had been endeavor-

ing to develop a hand method welt lasting machine. This machine had not been made commercially satisfactory (R. Vol. 1, p. 400, lines 27–32).

C. Business of the McKay Company.

This company manufactured and leased patented metallic fastening machines, used to insert metallic fastenings, and patented heeling machines, used for the preparation and attaching of heels (R. Vol. 1, p. 4, lines 23–36).

D. Other Concerns acquired by the United Company at its Formation.

Incidentally to the acquisition of the three constituent companies mentioned above, the United Company acquired the following concerns:

The *Goodyear Company of Canada* and the *International Goodyear Company.* These concerns respectively held the patents for the Goodyear Company's inventions which had been taken out in Canada and abroad and they were furnishing the Goodyear machines in Canada and abroad under those patents. The acquisition of these concerns merely enabled the United Company to furnish Goodyear machines outside the United States.

The *Davey Pegging Machine Company.* This company made a pegging machine used in attaching the soles of shoes by pegs. It did not compete with any of the other companies. As few pegged shoes are made its business was small. In 1911 the United Company had only 146 Pegging Machines outstanding (Defs.' Ex. 228, R. Vol. 5, p. 430).

The Davey Company was a subsidiary of the Consolidated Company, and was acquired incidentally as a result of the acquisition of that Company.

E. Acquisition of the Eppler Company.

The Eppler Welt Machine Company and its subsidiary the International Eppler Welt Company were attempting to furnish a patented welter, stitcher, and a few auxiliary machines for making a welt shoe by the Eppler process. This process was, as the record shows, much inferior to the Goodyear process, and although the Eppler Company had been organized for a number of years it did practically no business, and in 1899 it was evident that its machines were doomed to failure. Its machines infringed the Goodyear Company's patents, patent suits brought by the Goodyear Company were pending to enjoin their use, and counsel for the Goodyear Company was confident of success. After the formation of the United Company was agreed upon, it was found that the Eppler Company could be acquired and the litigation thus settled. The Eppler Company was accordingly acquired, not to obtain its business, as it had practically none, but to enable the United Company to start business free from litigation (*infra*, pp. 52–55).

F. Field Occupied by the Constituent Companies.

As shown above each of the constituent companies was engaged in manufacturing a limited class of machines which it had created and developed under its patents, and in which it specialized. They were not in competition.

Thus the Goodyear Company made a welter, stitcher and certain auxiliaries and a machine for lasting women's welt shoes. The Consolidated Company made lasting machines for men's welt, McKay and heavy nailed shoes. The McKay Company made metallic fastening and heeling machines.

These machines were all used in the bottoming of shoes. They did not, however, include all machines used for this purpose. Thus the constituent companies did not manufacture the McKay Sewing Machines used for attaching the uppers to the bottoms of substantially one-half of the shoes manufactured in 1899 (Defs.' Ex. 215, R. Vol. 1, p. 424). They did not manufacture any of the General Department Machines, of which the United Company now manufactures over 170 different kinds (Defs.' Ex. 227, R. Vol. 5, p. 425), and a number of which are used in the bottoming process.

Furthermore, they made no machines for cutting out, sewing and making the uppers of shoes, or button-hole machines, and of course they did not manufacture the 39 machines which have been invented by the United Company since its organization for performing operations previously performed by hand.

The field occupied by the constituent companies, therefore, was comparatively limited.

Defendants' Exhibit 221A (R. Vol. 5, p. 370A) gives a list of eighty-five different dealers in machinery, findings and supplies advertising in the trade papers in the years 1899 to 1902, which the United Company did not purchase and made no attempt to purchase. This list includes such important companies as the Wheeler & Wilson Sewing Machine Company, which supplied probably 90 per cent.

of the machines which united the parts of the upper of the shoe (R. Vol. 1, p. 415, lines 12–14), and the Reece Buttonhole Machine Company, which furnished probably every machine for making buttonholes in shoes and for finishing the buttonholes (R. Vol. 1, p. 415, lines 15–17).

The fact that the United Company made no attempt to acquire these other important companies establishes conclusively that the United Company was not formed for the purpose of acquiring all concerns engaged in the shoe manufacturing business, and further that it did not plan, as alleged in the petition, to require shoe manufacturers to take from it all shoe machines which they needed.

G. Capital of United Company.

The United Company was organized with $25,000,000 authorized stock, half common and half preferred. A total of $17,247,000 of stock was issued. Of this amount $14,851,565 par value was issued in exchange for stock of the Goodyear, International Goodyear, the Consolidated, and the McKay Companies. $2,395,435 par value was issued for cash which was used for the purchase of the Eppler Company, Canadian Goodyear Company, for payment of debts of the constituent companies, organization expenses, and $500,000 working capital (see Main Brief, pp. 91–92).

The par value of the stock issued did not exceed the value of the stock and properties acquired (see Main Brief, p. 92), and the District Court so found (see Main Brief, p. 49).

2. PURPOSES FOR WHICH THE UNITED COMPANY WAS FORMED.

Prior to the formation of the United Company a shoe manufacturer would lease his welt machines from the Goodyear Company, his lasting machines (except for women's welts) from the Consolidated Company, and his metallic fastening and heeling machines from the McKay Company.

This situation had serious disadvantages, both to the shoe manufacturers and to the companies, and prevented an efficient use of the machines. It was undoubtedly one of the reasons that the welt machines were not more largely used and that half of the shoes then manufactured were lasted by hand instead of by machine.

In the first place it is essential to the efficiency and productivity of such machines that service be rendered with them by the manufacturer of the machines. We have explained above the vital importance of this service which consists in furnishing skilled mechanics to repair machines, in keeping a stock of repair parts at some convenient place near the shoe manufacturer's factory, and in instructing operatives in the use of the machines (*supra*, pp. 30–31). If a single machine of a series of bottoming machines breaks down, it stops production on the entire series. In many small factories which have a single machine of a kind, this means stopping the work of the entire factory. It further means that lessors of all the machines of the series receive no royalty while they are not producing shoes.

Each of the constituent companies was endeavoring to furnish service, but no one of them had by itself sufficient

machines outstanding in any one factory to enable it to furnish a satisfactory service. Originally most of the shoe manufacturing business was done in Massachusetts near the company's plants so that new parts and mechanics could be furnished the shoe manufacturer within a comparatively short time.

As the shoe manufacturing business spread over the country, it was absolutely essential to the efficiency of the machines that the constituent companies should maintain offices at convenient places in the various shoe manufacturing districts of the country, maintain mechanics at such offices, and also keep there a full supply of parts. None of the constituent companies could afford to do this satisfactorily.

The result was that each company suffered, and furthermore, no one company could remedy the situation. If, for example, the Goodyear Company gave good service and the McKay Company did not, the machines of the Goodyear Company would be out of use whenever the McKay machines broke down.

Furthermore, in furnishing such service as was given there was much unnecessary duplication of expense. Each company had its offices or agencies in the same place and each was sending mechanics to the same factory (Main Brief, p. 175–178).

In the case of shoe machinery, one machine prepares the work for the succeeding machine. The principal bottoming machines must be constructed and adapted for use together; otherwise they cannot be used together at all or poor work inevitably results (see Main Brief, pp. 334–340). As the different bottoming machines were made by the different constituent companies, each of which had its own ideas, there was not complete harmony between them.

Again, there are many parts of the various machines in common. Had the machines all been manufactured by one company these parts could have been standardized and the same part in many cases be used in a number of different machines, thus obviating the necessity of carrying so many different kinds of parts. Owing to the fact that the machines were manufactured by different companies, there was no standardization of parts, which resulted in much inconvenience and expense (Main Brief, pp. 168–170).

Mr. Winslow, who was the chief executive of the Consolidated Company, and Mr. Howe, who was the executive head of the Goodyear Company, early in 1898 came to the conclusion that if the Goodyear Company, making welt and turn machines, and the Consolidated Company, making lasting machines, were consolidated in a single company, such company could greatly improve the service rendered lessees of the machines, could economize in the manufacture of the machines by concentrating the manufacture in one factory and by standardizing the parts, and as a result could greatly increase the productivity and efficiency of the machines. The result would be increased production by the machines, greater satisfaction to lessees, a reduction in the charges made for the machines, and an increase in the total royalty earned by each machine. It was further believed that by lowering the cost of the machines and improving the service, shoe manufacturers would be encouraged to increase their manufacture of Goodyear welt shoes, the best type of shoes made, but the most difficult to manufacture (see Main Brief, pp. 159–160). Mr. Winslow's testimony as to the reasons for the formation of the United Company appears in R. Vol. 1, pp. 407–413.

The same reasons which caused Mr. Winslow and Mr.

Howe to deem it highly desirable that the Goodyear and Consolidated Companies should be united, of course applied equally to the consolidation with them of the McKay Company, which made heeling and metallic machines, the two other important elements then required in a series of bottoming machines. After the consolidation of the Goodyear Company and the Consolidated Company was agreed upon, but before it was consummated, the McKay Company was, therefore, approached and agreed to unite with the others. Mr. Winslow testified (R. Vol. 1, p. 529, line 27):—

> "The McKay people were approached because I advised it, and I advised it because I believed that with the metallic and heeling machines and the Goodyear machines and the lasting machines we could give better service, get a better product from the machines, and give better results both to the manufacturers and to ourselves.
>
> ". . . the unification of the service would allow those machines to be kept in continuous operation, giving a larger productive capacity to them and at less expense than in any other way."

Another incidental reason for the formation of the United Company was that Mr. Howe, who was the real manager of the Goodyear Company, and Mr. Brooks, who managed the McKay Company, could not devote much of their time to the business and wished to withdraw. By combining these businesses with the Consolidated Company the services of the men active in that company were obtained (see Main Brief, p. 161).

Both Mr. Winslow and Mr. Howe denied specifically any intent to monopolize shoe machinery as charged in the petition (see Main Brief, p. 163).

The directors of the three constituent companies sent

out circulars to their stockholders announcing the plan for the consolidation and recommending that it be carried out. These circulars expressed briefly the purposes testified to by Mr. Winslow and Mr. Howe. They show the belief that great advantages would accrue from one concern furnishing the different types of shoe machinery used by shoe manufacturers and that economies would result therefrom (see Main Brief, pp. 161–163).

3. THE FORMATION OF THE UNITED COMPANY WAS HELD LAWFUL IN UNITED STATES v. WINSLOW, 227 U. S. 202.

The question of the legality of the formation of the United Company was before this Court in *United States* v. *Winslow*, 227 U. S. 202. The indictment in that case set forth almost precisely the same facts in respect to the formation of the company as the present petition, with the exception that the United States in framing the indictment in that case did not deem the Eppler Company of sufficient importance to refer to it. It was alleged, as in the present case, that the constituent companies were making machines under their various patents.

It was held in that case that the combination was so obviously "on the face of it" simply "an effort after greater efficiency" and so unadapted to accomplish an illegal purpose, that even the unlawful intent which was charged would not make it unlawful.

The Court said (p. 217):—

> "On the face of it the combination was simply an effort after greater efficiency. The business of the several

> groups that combined, as it existed before the combination, is assumed to have been legal. . . . The disintegration aimed at by the statute does not extend to reducing all manufacture to isolated units of the lowest degree. It is as lawful for one corporation to make every part of a steam engine and to put the machine together as it would be for one to make the boilers and another to make the wheels. Until the one intent is nearer accomplishment than it is by such a juxtaposition alone, no intent could raise the conduct to the dignity of an attempt. ". . . we can see no greater objection to one corporation manufacturing seventy per cent. of three non-competing groups of patented machines collectively used for making a single product than to three corporations making the same proportion of one group each."

The United States has sought to differentiate the present case on the following grounds:—

1. It contends that there was competition between the Ideal lasting machine of the Goodyear Company and the lasting machines of the Consolidated Company.

2. It contends that the Eppler Company was not mentioned in the indictment of *United States* v. *Winslow;* and that there was competition between the Goodyear Company and the Eppler Company.

The elimination of this competition it alleges was a motive for the formation of the United Company, or made its formation inherently unlawful.

The District Court found that there was no actual competition of any significance either in lasting or welting machines, and no unlawful intent shown in connection with the organization of the Company.

However, as the United States has laid such stress on these contentions, we have considered the evidence at length in our Main Brief (Alleged Lasting Machine Competition,

Main Brief, pp. 94–132, Alleged Eppler Company Competition, Main Brief, pp. 133–158), and we shall briefly consider these contentions in this Summary.

4. ALLEGED COMPETITION BETWEEN THE GOODYEAR COMPANY AND THE CONSOLIDATED COMPANY IN LASTING MACHINES.

The Goodyear Company at the date of the formation of the United Company manufactured 19 different machines; namely, its welt and turn machine, outsole machine, 13 welt auxiliary machines, 3 turn auxiliary machines, and the Ideal lasting machine. Its principal business, as we have stated, was the manufacture of its Goodyear welters, stitchers, and auxiliary machines, the field it had created and developed by its inventions. Only 248 Ideal machines were outstanding and their use was comparatively insignificant. Thus in 1899 only .77 of 1 per cent. of the shoes lasted by machines in that year were lasted on Ideal machines, and, as not more than half the shoes made in that year were lasted by machines, less than .40 of 1 per cent. of the total shoes lasted in 1899 were lasted on the Ideal machines (see Main Brief, pp. 84–85, 114).

The total possible competition, then, between the Goodyear Company and the Consolidated Company consisted in one type of machine out of 19 different types produced by the Goodyear Company, and this machine was used on less than .40 of 1 per cent. of the shoes made.

But further than this the Ideal machine was adapted for use only on women's welt shoes. While it was possible

to use it on men's welt shoes, it was not structurally adapted for such use and was so used to an insignificant extent. The Consolidated Company on the other hand had no machines which were adapted for use or could be used commercially on women's welt shoes, the field of the Ideal machine.

There is therefore no foundation whatsoever for the contention of the United States that the Ideal machine competed in any practical sense with the Consolidated Company's machines.

A. Use of the Ideal Machine.

Mr. Howe testified:—

> "The Ideal Laster was adapted to work on women's welts, light leather, which no machine in the market at that time would do successfully . . . . the machine was designed and almost wholly used for lasting women's welts" (R. Vol. 1, p. 626, lines 44–45; p. 627, lines 1–3).

The reason that the Ideal machine could not be used successfully on men's welt shoes was due to structural characteristics of the machine which rendered it unadapted for commercial use on men's shoes. Heavier leather is used on men's shoes and the dimensions of such shoes differ from women's. The Ideal machine was not adapted for dealing with these different characteristics. For a full statement of these structural differences, see Main Brief, pp. 104–106.

That the United States did not place much reliance on its contention that the Ideal machine competed with the Consolidated Company's machine is shown by the fact that it did not attempt in its direct case to introduce any evidence as to the use of the Ideal machine on men's welt

shoes, or the use of the Consolidated Company's Chase machine on women's welt shoes.

In its rebuttal it presented a number of witnesses in an attempt to show such use. As we point out below, these witnesses fail to show any use of the Chase machine on women's welt shoes, and their testimony as to the use of the Ideal on men's welt shoes, the field of the Chase machine, only confirmed the evidence of the defendants that the machine was used to an insignificant extent on men's shoes.

The testimony of most of the witnesses for the United States was not relevant to the issue at all. In the first place, some of them testified as to the use of the Copeland Rapid Lasting Machine, an earlier type of lasting machine, which had been put out by the Goodyear Company, but which was obsolete and no longer manufactured in 1899, so that the question of its possible use was immaterial at that date (Main Brief, pp. 106–108). A number of these witnesses testified only to the use of the Ideal machine on men's welt shoes long after 1899, when it appeared that, owing to a change in the type of shoes and to certain new inventions applied to the Ideal machine, which were naturally not foreseen in 1899, the difficulties encountered in lasting men's welt shoes with the Ideal machine were partially overcome (Main Brief, pp. 109–114).

This testimony showed that the Ideal machine was used in or prior to 1899 on men's welt shoes in only three factories, 18 machines at the most out of 248 machines outstanding being so used (see Main Brief, p. 114). The total use of the Ideal machine on men's welt shoes probably did not exceed .03 of one per cent. of the total shoes made in 1899 (see Main Brief, p. 114).

B. Use of the Chase Machine.

The Chase machine of the Consolidated Company was adapted and developed for lasting men's welt shoes as distinguished from women's welt shoes, the field of the Ideal. Mr. Winslow testified:—

> "The Chase lasting machine was especially adapted to and was developed for the lasting of men's welt shoes" (R. Vol. 1, p. 397, lines 39–40).

Mr. Howard, the patent expert of the United Company, who had been connected with it since its formation, testified:—

> "So far as I can learn, the Chase lasting machine was never used, either before or after 1899, in lasting women's welt shoes" (R. Vol. 1, p. 971, lines 10–14).

The United States in its rebuttal case attempted to show a use of the Chase machine on women's welt shoes, but utterly failed. No one of its four witnesses relied on for this purpose testified to such use. One testified to a use on women's McKay shoes, one to a use on women's shoes but not on welt shoes, and two testified that in their opinion it could be used on women's welt shoes but gave no instance of such use (see Main Brief, pp. 100–101).

The finding of the District Court (see Main Brief, p. 117) that the Ideal and Chase machines had different fields, that, although a few Ideal machines were used on men's shoes "notwithstanding their want of adaptation to such use," that no attempt was shown "to put either ma-

chine into the market as against the other," and that "no competition between the two in the usual sense of the term" was shown, is fully sustained by the record.

C. The Consolidated Company's Hand Method Welt Lasting Machine.

Prior to 1899 the Consolidated Company had attempted to construct a hand method machine which would last welt shoes, but it had only succeeded in constructing an unsuccessful experimental machine.

The reasons that the machine could not be used commercially are fully explained in our Main Brief, pp. 119–121.

While the Company had endeavored to put out the machines, as Mr. Winslow testified, they were not being accepted by the manufacturers, only a few were out, and they were being sent out and coming back.

Mr. Howard testified:—

> "the machines were being knocked around from pillar to post. They didn't stick. They would be sent out on trial and they wouldn't stay" (R. Vol. 1, p. 969, lines 4–6).

In 1900 a new device was invented and incorporated in the machine and later improved, which, for the first time, made the machine commercial (see Main Brief, p. 121). This invention, of course, was not known or foreseen at the date of the formation of the United Company and was only a possibility.

Not only then was there no actual competition between the hand method welt machine and the Ideal machine in 1899, but the hand method welt machine was an entirely

different type of machine from the Ideal machine, which was of the bed type. Even when the hand method welt machine later became commercially successful, it, therefore, found a field of its own more or less different from that of the Ideal (see Main Brief, pp. 123–124).

The finding of the District Court that the hand method welt machine was not commercial and was not an article of commerce in any practical sense in 1899, when the United Company was formed (see Main Brief, p. 125), is fully supported by the record.

D. Conclusion as to Lasting Machine Competition.

The record fails to disclose any competition of any practical significance between the Ideal machines of the Goodyear Company and the machines of the Consolidated Company.

We submit that it is self-evident that the United Company was not formed to eliminate the possible competition of the Ideal machine, which was only one out of 19 machines made by the Goodyear Company, and of which only 248 were outstanding out of over 4,200 lasting machines in use, and which was not adapted for use on any class of shoes for which the Consolidated Company had a commercial machine. It is clear that the purpose of the consolidation was to unite in the new company the Goodyear machines of the Goodyear Company and the lasting, heeling, and metallic machines of the other companies, as the defendants testified. The acquisition of the Ideal machine was not the reason for the formation of the United Company, but resulted incidentally because it happened to be owned by the Goodyear Company, there being no intent disclosed to eliminate competition

and no competition of any practical significance being eliminated.

We submit that it cannot possibly be contended with reason that the wholly insignificant use of the Ideal machine by three manufacturers on men's welt shoes for which it was not adapted made inherently unlawful the consolidation of the Goodyear Company and the Consolidated Company—a consolidation obviously beneficial to the companies and to shoe manufacturers.

And, finally, even if the Ideal machine had been adapted for use on men's welt shoes as well as women's, and had been used extensively in this field in competition with the Consolidated Company's Chase machine, and had been owned by a separate company, it would have been legal and proper for the United Company to acquire both machines. The Ideal machine was patented and was admittedly the only machine which could successfully last women's welt shoes. The United Company was entitled to furnish a machine for this purpose, which it could only do by acquiring the patents on the Ideal machine. The mere fact that it acquired the Chase machine which was used on men's welt shoes would not bar it from entering the field of furnishing lasting machines for women's welt shoes also in the only way in which this was at the time practicable or possible, namely, by the purchase of the Ideal machine.

It may be added that both the Ideal machine and the Chase machine have become obsolete.

5. ALLEGED COMPETITION BETWEEN THE GOODYEAR COMPANY AND THE EPPLER COMPANY.

Welt shoes differ from other types in the method by which the sole is attached. In the welt shoe a narrow strip of leather is attached to the outside of the upper and to the insole, and the outsole is attached to this welt. In McKay shoes the sole is attached directly to the insole by a seam which runs through both and thus appears on the inside of the shoe. In pegged and metallic fastened shoes the outsole is attached by pegs, nails, or screws.

In the Goodyear welt shoe the upper, insole and welt are first sewed together by a chain stitch. A light single thread lies in a prepared channel in the insole, and the double thread is laid on the welt outside the surface on which the foot rests. As a result, there is no seam which can disturb the foot.

In the Eppler welt process the bulky double thread of the chain-stitch was laid in the prepared channel in the bottom of the insole and under the surface on which the foot rests (see Main Brief, p. 133). The Eppler machine was so organized that it could only make the shoe in this way, so that it was impossible to use the Eppler machine on women's welt shoes, which have light inner soles, or on turn shoes, and it was much inferior to the Goodyear machine (see Main Brief, p. 134).

The contention of the United States appears to be that even if the Eppler Company did a very small business it was the only company outside of the Goodyear Company

which furnished machines for attaching the soles by welts, and that by its acquisition all competition, even if trivial, in welt machines was eliminated. But, as we have shown, the welt method was only one of several methods of attaching the soles. Welt shoes constituted about 10 per cent. of the total shoes made in 1899 and McKay shoes nearly 50 per cent. The Goodyear machines did practically all of this welt work then done, the Eppler Company's machines doing an insignificant amount. There were only 30 to 40 Eppler welters outstanding, about a third of which were in the factory of the president of the Eppler Company (see Main Brief, p. 141). The Eppler method of shoe making was, as we have shown, quite different from the Goodyear and was only one of a number of methods. So far as competition can be said to exist between different methods of attaching the sole, the real competition met by the Goodyear Company was from the McKay method of attaching the sole and not from the trivial and inferior work done by the Eppler machines.

That the Eppler Company, although it had been in business since the early 90's, did a trivial business, is undisputed. The reason is clear. In spite of the testimony of a few witnesses for the United States that the Eppler machines did good work, the record abundantly shows that these machines were inferior to the Goodyear and bound to become obsolete, as they have since become.

The outstanding characteristic of the Goodyear shoe which makes it the best shoe made is that no seam can be felt by the foot. In the Eppler shoe the bulky double chain laid on the inner sole was likely to cause a ridge under the foot. Thus Mr. Keith, the president of the Eppler Company, testified that this double stitch had a tendency

to raise a ridge or lump around the inside of the sole against the foot, which had the effect both of lessening the durability of the shoe and of making it uncomfortable (R. Vol. 1, p. 391, lines 10–17).

Charles S. Smith, a witness for the United States, testified that the chain-stitch of the Eppler machine,—

> "being larger and more bulky than the single stitch, occupied more room and was likely to leave a ridge around the inside of the shoe, which would come against the foot" (R. Vol. 1, p. 353, lines 6–9).

It was necessary to use a thick and expensive insole to prevent the seam from hurting the foot, which added greatly to the expense of making Eppler welt shoes (R. Vol. 1, p. 415, lines 36–43).

The Eppler machines were also inferior in construction to the Goodyear machines (R. Vol. 1, p. 677, lines 17–21).

Furthermore, the Eppler Company did not have a complete or satisfactory set of auxiliary machines which are essential to the successful manufacture of welt shoes. It lacked important auxiliary machines such as were supplied by the Goodyear Company and were essential to the commercial success of the welt process (see Main Brief, p. 143).

Most of the witnesses for the United States admitted that the Goodyear machines did better work and were superior (see Main Brief, pp. 144–148).

Furthermore, the Eppler machines infringed the Goodyear Company's patents and eight suits were pending to enjoin the use of these machines. The far-reaching character of these patent infringements is set out in our Main Brief, pp. 136–138. It thus appears that, even had the

Eppler machines been in any practical sense competitive, such competition was in violation of the Goodyear Company's patent rights and it was entitled to terminate it by suits in equity or by purchase.

It is clear that it was not the defendants' purpose in forming the United Company to eliminate this trivial competition. The United Company was agreed upon before the acquisition of the Eppler Company was even considered (see Main Brief, p. 138).

It is also clear that the acquisition of the Eppler Company had no effect of any significance on the position of the United Company. Any one to-day can manufacture these machines since the patents have expired, but no one does so, because no one desires to make shoes by this inferior Eppler process.

The sole purpose Mr. Winslow had in acquiring the Eppler Company was to terminate the patent litigation and thus enable the United Company to start business free from litigation (see Main Brief, pp. 134–136). Had the litigation brought by the Goodyear Company been continued, it would have been necessary for the United Company in certain cases to sue its own lessees who were using Eppler machines and also using the lasting, heeling and metallic machines of the Consolidated Company and the McKay Company (see Main Brief, p. 135). An incidental reason in Mr. Howe's mind was that the Eppler machines made a different kind of shoe from the Goodyear shoe and the acquisition of the Eppler patents would enable the United Company to furnish machines for this kind of shoe if any lessee desired to make them (see Main Brief, p. 155). Only two or three did and the machines rapidly became obsolete.

6. CERTAIN STATEMENTS RELIED UPON BY THE UNITED STATES TO SHOW UNLAWFUL INTENT IN THE FORMATION OF THE UNITED COMPANY.

The United States in an endeavor to prove the existence of the unlawful project which it charges in the petition, and further to show that the United Company was formed as a first step in the carrying out of this unlawful project, relies upon certain statements which, it contends, show an unlawful intent existing at the date of the formation of the United Company.

The circular issued to the Goodyear stockholders contained, among other things, the following statement (R. Vol. 4, P.'s Ex. 152, p. 1097):—

> "The United Company will also from time to time acquire other shoe machinery properties, either by direct ownership or by purchase of shares of their stock."

This statement, the United States says, shows the unlawful intent to acquire all competing concerns which it charges. The contention is without the slightest foundation. There were numerous types of machines which the constituent companies did not make. Mr. Howe, who drew the circular, testified that he had in mind that the United Company, if successful, would naturally take over some of these other machines which supplemented but did not compete with the machines of the United Company. The United Company by so doing would not eliminate competitors but would merely add additional types of machines. No

intent is evidenced to acquire competing machines (see Main Brief, pp. 161–163).

A similar recital in a contract made in September, 1899, seven months after the United Company was formed, with Peabody & Co., of Australia, agents for the United Company, to the effect that the United Company contemplated acquiring other lines of machinery and shoe findings, had the same significance. The United Company had in mind at the time acquiring the business of making blackings, cements, and stains, which it did not then manufacture, and which Peabody & Co. wanted to obtain a supply of. This recital was inserted in the contract under which Peabody & Co. agreed to act as agents in order to assure them that the United Company contemplated furnishing them with these supplies and possibly with other supplies or machinery which it did not manufacture at the time. (See Main Brief, pp. 164–165).

Testimony of Mr. Howe that he was opposed to mere working agreements between the constituent companies and wished a consolidation because he felt a mere working agreement between them might be held in restraint of trade is relied on by the United States as a confession of unlawful purpose to eliminate competition. Mr. Howe obviously did not fear that such a working agreement would restrain competition between the constituent companies, because he testified no competition existed. His notion was that an agreement whereby each of the companies obligated itself to manufacture its machines in a certain way, to join in furnishing service and in other ways to agree to act as though consolidated, might be deemed an improper contract for a corporation to obligate itself to, as it would have the effect of a consolidation, although such consoli-

dation was not formally agreed to. He did not have restraint of competition in mind (see Main Brief, pp. 165–166).

The insistence of the United States on these statements shows the utter lack of testimony on which to base its contentions.

7. METHODS BY WHICH AND EXTENT TO WHICH THE PURPOSES FOR WHICH THE UNITED COMPANY WAS FORMED HAVE BEEN CARRIED OUT.

Before considering the various transactions occurring after the formation of the United Company which the United States relies upon as showing the adoption and execution of the unlawful project charged, we shall briefly consider the extent to which the purposes for which the United Company was formed have been carried out.

This inquiry is of the greatest importance in the present case, not merely because it confirms the defendants' testimony as to their motives in forming the United Company, but also because—

(*a*) It shows conclusively that the formation of the United Company for the purpose of enabling it to carry out these purposes, far from "prejudicing the public," has been of enormous benefit to the development of the shoe industry and consequently to the public.

(*b*) It further shows that the continuance of the success which the constituent companies had at the date of the formation of the United Company followed from the improvements which the United Company made in its machines, the efficient service it rendered users of its machines and the

remarkable new machines it invented. The record thus fully substantiates the District Court's finding that the United Company's success was due to the excellence of its patented machines and the service rendered with them.

A. Improvements in Service.

Service to the shoe manufacturer, as we have stated, consists in repairing and adjusting machines, supplying new parts by having a depot near at hand, instructing operators and furnishing operators, in case the shoe manufacturer is unable to obtain them, in order to keep his factory going, and in acting as engineer generally and advising as to the best machines for a particular purpose or as to the best methods of manufacturing shoes.

Such service to be effective must be almost instantaneous. The business of a shoe manufacturer in Chicago, Philadelphia, or even Brockton, which is about forty miles from the United Company's factory at Beverly, is seriously handicapped if he must send to Beverly for a new part, or for a man to repair or adjust a machine. This is, as we explained, because if a single machine of the bottoming series breaks down it stops work completely on an entire series of bottoming machines. In every factory this is serious; in the majority of the factories of the country which require but one of many types of machines such a breakdown of a single machine stops the entire production of the factory until it can be repaired.

In 1899 each of the constituent companies attempted to furnish service so far as it could in view of its financial resources and the comparatively small number of machines it had outstanding. Not one of the three companies, how-

ever, gave a good service (see Main Brief, p. 176; see also testimony of Jonathan Brown, Main Brief, p. 178).

Almost immediately after the formation of the United Company the plans with reference to the improvement of the service commenced to be put into effect and the different offices of the constituent companies in any one place were amalgamated into a single office (see Main Brief, p. 178).

In 1911 the United Company had 27 different stations in 13 different states. At each of these depots or stations mechanics are kept to repair machines and instruct operators. These men answer calls for service from shoe manufacturers situated in their district, immediately travelling to the shoe manufacturer's factory. A stock of parts is carried in each of these depots for practically every machine which the United Company produces so that its mechanics are in a position to repair any machine immediately. The investment in parts carried by the United Company in 1911 for the service alone (not including any parts for new machines) was $1,415,474.49 (see Main Brief, p. 179).

The number of roadmen employed in this service increased from 237, employed by the United Company in 1899, to 689 employed in 1913, and the number of branch office managers and assistants increased from 12 to 31 (R. Vol. 5, Defs.' Ex. 211, p. 293). The total calls answered in the year 1911 were 192,524, and including calls for instruction to operatives 201,413. The time of the roadmen occupied in this work consumed 1,365,384 hours (see Main Brief, p. 179).

The number of operatives taught during 1911 was as follows:—

Goodyear operators taught	2,209
Metallic operators taught	956
Heeling operators taught	1,006
Lasting operators taught	1,359
Pulling-over operators taught	956
Eyelet and general operators taught	2,403
Total operators taught	8,889

Defendants' Exhibit 214 (R. Vol. 5, p. 311) shows in detail the number of calls made by each office, the number of operators taught through each office, and the number of hours consumed in this service.

Defendants' Exhibit 213 (R. Vol. 5, p. 298) shows the number of times service was rendered L. A. Crossett, Inc., a typical shoe manufacturer. The total calls as shown by that exhibit for the year 1911 (p. 311) were 1,150, or almost four for each working-day.

This service is rendered absolutely free of charge to shoe manufacturers. Shoe manufacturers are not even charged with the travelling expenses of the roadmen. All they pay is the cost of new parts (R. Vol. 1, p. 421, lines 18–23). This service cost the United Company for the year 1911 $1,196,494.86 (R. Vol. 1, p. 974, line 22).

The United Company is the only shoe machinery company which furnishes service of this satisfactory character (R. Vol. 1, p. 423, lines 1–4).

As to the improvement of the service, Mr. Winslow testified as follows (R. Vol. 1, p. 420, lines 35–45):—

> "As to the development of the service for shoe manufacturers since 1899, the service is now so far ahead of what existed in 1899 that there is really no comparison. At each depot is a general manager and a body of men who are experts in the adjustment and repair of all the

machines. These men are at the call of the manufacturers by telephone at any moment of the day and are at their service nights, if necessary, to rearrange their factories or readjust their machines. There are men to teach new operatives how to run the machines and how to take care of them. That service is complete in each shoe manufacturing district in the country."

Numerous shoe manufacturers testified as to the necessity for this service and the very effective service which the United Company renders.

JOHN STROOTMAN, a shoe manufacturer of Buffalo, New York, making from 800 to 1,200 pairs per day (R. Vol. 1, p. 742, lines 41–43), testified:—

"The service which the United Company gives us is excellent, and it is an all-important factor in the manufacture of shoes. We could not run a factory without the company's skilled men to keep the machines in order and keep them running. So far as I know, no other company furnishing shoe machines gives service of that kind" (R. Vol. 1, p. 744, lines 12–17).

C. WILLIS BENNETT, a shoe manufacturer of Fitchburg, Mass., making from 800 to 1,400 pairs a day (R. Vol. 1, p. 757, lines 32, 42–43), testified:—

"As to my experience with them with reference to service, why, their service has been, I might say, indispensable. I don't know what I should do without their service. Whenever I have a machine break down, I immediately telephone to their branch office at Marlboro, and they have a man come up there from Marlboro, who is an expert on that particular machine, to put the machine in order, and they do all this without any expense to me, aside of course from the cost of the broken part of the machine, if there are any parts broken" (R. Vol. 1, p. 758, lines 36–44).

ROBERT P. HAZZARD, a shoe manufacturer of Gardiner, Me., making about 5,000 pairs of welt shoes a day (R. Vol. 1, p. 640, lines 34–35; p. 641, line 10), testified:—

> "The United Company's service is one of the greatest necessities for the economical running of a modern shoe factory. . . .
>
> "When manufacturers get that service it not only means bigger wages for the employees, but it means better results for the manufacturer and cheaper shoes for the consumer. In my judgment, with the United Company's service the consumer is buying shoes cheaper than he could if the royalty were done away with and efficient service were not furnished" (R. Vol. 1, p. 643, lines 16-17, 42–p. 644, line 3).

For further testimony of shoe manufacturers as to the service rendered by the United Company, see Main Brief, pp. 181–187.

B. Concentration in One Factory and Standardization.

When the United Company was formed, the Goodyear Company manufactured its machines in Boston. The Consolidated Company was located in leased premises at Beverly, Mass., and the McKay Company had its factory at Winchester, Mass., which was unsuited to the purpose, as there was no labor market.

As Mr. Winslow testified, one of the purposes in forming the United Company was to economize in the manufacture of machinery by bringing that manufacture into one modern factory and standardizing the manufacture (see Main Brief, pp. 159–160). Shortly after the United Com-

pany was formed a committee was appointed to visit various manufacturing plants and gather data as to the best methods of manufacture, the most efficient machines, the most efficient arrangement for carrying on the manufacture from one department to another, and the best character of factory for the operatives.

After about a year's work by this committee a new concrete factory was built at Beverly, Mass. The factory had its own foundry. Provision was made for the standardization of parts which effected a considerable saving, and the consolidation of the three factories also effected a large saving in management expenses.

For testimony as to the concentration in one factory and the standardization of parts, see Main Brief, pp.168–170.

C. Inventions and Improvements in Machines Made by the United Company.

While the machines of the constituent companies at the date of the formation of the United Company represented remarkable inventions, and were the best or the only machines of the kind invented, the art of shoe machinery was young, and was, and still is, capable of great development. Not only was it possible by new inventions to add improvements to the existing machines which would greatly increase their efficiency, and with the assistance of the patents embodied in those machines and of fresh inventions to create new and better machines to take their place, but it was possible to invent machines to perform many operations which were at the time still carried on by hand.

To carry on the work necessary to develop this field a large expenditure for research and experimentation

was necessary. The formation of the United Company and its larger resources, as was expected, made this possible.

Soon after the United Company was formed the development of inventions was put in the hands of a committee of inventors. Every new idea was submitted to this committee, and, if reported upon favorably, work was undertaken to develop it. A large organization has been employed by the United Company for this work (see Main Brief, pp. 187–189).

In this experimental work the United Company has expended very large sums of money. For example, from 1907 to 1911 a total of $2,267,954.70 was spent (R. Vol. 1, p. 426, lines 25–39).

Defendants' Exhibit 217 (R. Vol. 5, pp. 323–51) is a typical report showing the experimental work done during the month of October, 1911. It shows that work was done on 61 different machines or parts of machines during that month. The report sets out in detail each of the machines on which work was done and the expenditure on each.

In addition to conducting its own Experimental Department the company has purchased from others such inventions offered it as it was thought would improve its machines.

The result of this effort and expenditure of money has been a remarkable development in the art of shoe machinery.

The United Company has, since 1899, brought out at least an average of 7 or 8 new machines a year (R. Vol. 1, p. 427, lines 12–13).

Mr. Winslow testified that since 1899 the United Company has invented and put out to its customers 150 new machines.

These are shown in a list—Defendants' Exhibit 246—(R. Vol. 1, p. 503, lines 7–23). 39 of these machines do work previously done by hand (Defs.' Ex. 247, R. Vol. 5, p. 690).

Among the striking illustrations of new machines which the United Company has invented to take the place of hand work are the Rex Pulling-over Machine and its auxiliaries and the clicking machine. They have resulted not only in much better work, but in a large saving to shoe manufacturers. The pulling-over machine was first put out about 1903 and the auxiliaries later, and the clicking machine was first put out about 1908. These machines are referred to more fully in our Main Brief, pp. 189–190.

All of the machines put out in 1899 have been improved and the greater part of the principal machines have been replaced by new or improved machines.

In the Goodyear Department, for example, nearly all the machines have been so replaced (R. Vol. 1, p. 430). In addition, numerous new auxiliary machines have been introduced. Thus in 1899 the United Company supplied 13 auxiliary machines for use in making welt shoes, while in 1911 it supplied 35 such auxiliary machines. In 1899 it supplied three Goodyear auxiliary machines for making turn shoes, while in 1911 it supplied nine such auxiliary machines (R. Vol. 5, Defs.' Exs. 242–245, pp. 681–683).

The machines which the United States contends that the United Company has monopolized are these improved or new machines, all of them patented, and a number of them performing work which was performed by hand until these machines were recently invented by the United Company.

When the United Company developed a new machine, or an improved model of a machine, to take the place of an existing machine, it substituted the improved machine for the old machine then under lease without any charge to the shoe manufacturer and the old machine was taken back and scrapped (see Main Brief, pp. 189, 190). By this liberal policy it has enabled lessees to have at all times the most up-to-date shoe machinery without any loss due to discarding the machines they held. When it developed a new auxiliary machine it furnished it to lessees for a nominal initial payment or rental without charging any additional royalty whatsoever.

D. Increased Efficiency of Machines Resulting from Inventions and Service Furnished by United Company.

The improvement in the defendants' machines, the addition of new machines to assist in the work of the principal machines and the service which the United Company has been able to render in connection with its machines have resulted in a remarkable increase in their efficiency. The result has been that each machine has been able to turn out a greatly increased number of shoes.

For example, each Goodyear welt sewing machine in 1910 sewed 66.7 per cent. more shoes than in 1899; each Goodyear outsole stitching machine sewed 69.5 per cent. more shoes in 1910 than in 1899; each Goodyear welt sewing machine used for turn sewing sewed 54.3 per cent. more shoes in 1910 than in 1899; each heel-attaching machine attached 62.3 per cent. more shoes in 1910 than in

1899; each lasting machine lasted 24 per cent. more shoes in 1910 than in 1899 (R. Vol. 1, pp. 428–429).

E. Savings to Shoe Manufacturers by Reduction of Charges and Increased Efficiency of Machines.

Shoe manufacturers have benefited both directly and indirectly from the increased efficiency of the United Company's machines and the better service it has rendered with them.

They have benefited directly by a reduction in royalties and initial payments charged by the United Company, which reductions the United Company has been able to make because its return in royalties from machines, each of which, being more efficient, operated on an increased number of shoes, has been larger. They have also benefited directly by the saving in material effected by the use of many of these machines, such, for example,—as the clicking machine, which effects a great saving in leather, and the improved welter, which Mr. Hazzard, a shoe manufacturer, testified saved at least $500 per machine a year in welting alone (see Main Brief, p. 544).

Shoe manufacturers have also benefited indirectly from the fact that their business has not been interrupted by the breaking down of machines, and because, owing to the improved service rendered and the increased capacity of the machines, a less number of machines requiring less factory space can do more work, and also because they have been furnished with many machines to perform more efficiently and quickly operations previously performed by hand. Such indirect savings cannot be estimated with any exactness, but they are very large.

The direct savings are also large. Mr. Winslow testified that the savings effected in 1911 over 1899 in the manufacture of the Goodyear welt shoe, by reason of the increased efficiency of the machines and the decrease in royalties, was 8¼ cents per pair. He gave in detail the savings effected by various new or improved machines used in the manufacture of welt shoes (see Main Brief, pp. 192–194).

The total royalty per pair of shoes charged for all the principal royalty machines furnished by the United Company for the manufacture of Goodyear welts is 5.694 cents for men's welts and 4.694 cents for women's and misses' welts; the total royalty for all the principal royalty machines furnished for women's and misses' turn shoes is 1.972 cents, and for children's turn shoes .5 cents; the total royalties for the principal royalty machines used for men's and women's McKay shoes is 1.746 cents, and for children's McKay shoes 1.391 cents (R. Vol. 1, p. 503, lines 29–36). In addition there are very small annual rentals on certain machines which add no appreciable amount to the cost per pair of shoes (see Main Brief, pp. 196–197).

It will thus be seen that the saving on a welt shoe effected since 1899 is more than the total royalty now charged.

The royalty for the turn machine was reduced 50 per cent. shortly after the formation of the United Company (R. Vol. 1, p. 503, lines 2–4). The United Company acquired a sole-laying machine for which a royalty of ¼ cent per pair was charged previous to its acquisition by the United Company, and an insole machine for which a royalty of ½ cent was charged previously to its acquisition, and the United Company has added both these machines to its Goodyear auxiliaries and leased them to shoe manu

facturers without charging any additional royalty whatsoever, thus saving the shoe manufacturer ¾ of a cent per pair (see Main Brief, p. 192).

The United Company has also practically eliminated the installation charge or initial payment previously charged for its machines. Thus, for installing an equipment of machines for making welt shoes to operate on 1,000 pairs of shoes per day the constituent companies charged $11,300.50 as an initial payment. In 1911 this initial charge including the first year's rentals of certain machines was reduced to $2,467.50, a saving to shoe manufacturers of $8,833 (see Main Brief, p. 196).

The United Company has in no case increased its royalties.

The United Company has also made reductions in prices of tools and supplies furnished shoe manufacturers (see Main Brief, p. 195).

And in addition to these reductions in royalties, initial payments, and prices for tools the United Company has furnished in all cases much improved machines, and in many cases new machines, without any increase in royalty or cost to the shoe manufacturer. Thus, as an example, though it has eliminated the initial payment for Goodyear machines which was charged by the Goodyear Company, the United Company now furnishes for welt work, for the same royalty charged in 1899, a vastly improved welter and stitcher all of a much larger capacity, and 35 auxiliary machines in place of 13 auxiliary machines furnished in 1899. On turn work it has reduced the royalty 50 per cent., has eliminated the initial payment charge, and in addition has furnished a much improved machine and 9 auxiliary machines instead of 3 fur-

nished in 1899 (R. Vol. 5, Defs.' Ex. 244, 245; R. Vol. 5, p. 683).

The formation of the United Company, and its consequent ability to economize in manufacturing expenses, in the cost of service, and to maintain a large experimental department have alone made these very large savings possible.

For a more complete statement of the savings to shoe manufacturers, see Main Brief, pp. 191–197.

F. Benefits to Operatives of the Machines.

Operatives of shoe machines are generally paid by the piece, that is, a certain amount for each pair of shoes operated on by them. Any increase in the efficiency of the machines tending to a larger production per machine thus increases the number of shoes worked on by each operative. The increased efficiency of the United Company's machines has resulted in an increase in the compensation paid operatives, although shoe manufacturers have in many instances actually reduced the piece price.

Thus the testimony shows that the average output of the Model K Welter is 40 dozen pairs a day instead of about 25 dozen pairs on the old machine and that an operative as a result can earn 20 per cent. to 36 per cent. more on the new welter, although the piece price on the old welter was one-third more than on the new (see Main Brief, p. 197). On the Model M Stitcher the operatives can earn 24 to 45 per cent. more than on the old stitcher, although the piece price is 40 per cent. less than on the old stitcher (see Main Brief, p. 198).

G. The Development by United Company of Goodyear Method of Making Shoes.

One of the purposes in forming the United Company, as testified by Mr. Winslow, was to encourage and increase the manufacture of Goodyear welt shoes, the best type of shoe made. This was to be done by the development of new machines to assist in that manufacture, by lowering the cost of installation of the Goodyear machines and by furnishing an efficient service to maintain the machines in operating condition, and to instruct operators in their use (R. Vol. 1, p. 407, lines 22–30). The United Company has consistently carried out this purpose and may be said to have specialized in machinery for making the Goodyear welt shoes.

It has, in the first place, enormously increased the efficiency of its welter and stitcher, the two principal machines used in this process. As we have shown above, it has greatly increased the number of auxiliary machines furnished with its welter and stitcher (*supra*, p. 70). It has eliminated the initial charges made in 1899 on its principal machines, resulting in a large saving to the shoe manufacturer (*supra*, p. 70).

There has resulted a great increase in the production of Goodyear welt shoes. In 1899, 22,700,000 pairs of welt shoes were made out of a total of 172,786,000. In 1910, 86,231,000 pairs of welt shoes were made out of a total of 278,916,000 (R. Vol. 1, p. 424, lines 24–35).

III.

THE EVIDENCE REGARDING DEFENDANTS' PATENTS.

The petition alleges in effect that in 1899 the important or basic patents on the principal machines were about to expire and that the defendants, knowing this, contrived a plan by which they could in effect create a new and unlawful monopoly to take the place of the lawful patent monopoly which they were about to lose through expiration of the patents; and this is what the United States expected and undertook to prove (R. Vol. 1, pp. 992–994).

The United States utterly failed to substantiate this charge. On the contrary, it was shown that at the date of the formation of the United Company the machines which the patent expert for the United States selected to sustain its charge embodied patents which had more than fourteen years to run.

The District Court found that the allegation was not proved and said:—

> "It seems obvious, therefore, that the allegations in question could not have been founded, when they were made, upon any adequate or complete investigation of the facts."
>
> . . . . . .
>
> . . . "I must regard the allegations here in question as not sufficiently supported by proof; and hold that no such motive is shown to have prompted either the organi-

zation of the United Company, or any of its subsequent doings" (R. Vol. 1, pp. 1133, 1134).

The United States has abandoned this contention. It was not mentioned in briefs or arguments for the United States at the first hearing in this Court. Accordingly, although the evidence on this issue is reviewed in the Main Brief (Main Brief, pp. 199–232), there is no occasion for taking time here for any analysis or discussion of that evidence.

The record shows that throughout the history of this industry every machine which has been useful has been patented. And the record further shows that practically all this patented development of shoe machinery has been accomplished by the United Shoe Machinery Company and its predecessors, and that the period since February, 1899, has been a period of more important and more rapid development than any corresponding period in the history of the industry.

The District Court held:—

"At any rate it must be accepted that from the beginning the machinery offered by the respondent corporation was, in all its essential elements, protected by patents, and that there has been no proof to the contrary" (R. Vol. 1, p. 1115).

IV.

LEASES OF SHOE MACHINERY.

Our next inquiry is whether the lease and license agreements under which the United Company furnishes its machines to be used by shoe manufacturers are, as the United States alleges in its petition, a step in carrying out the unlawful project charged.

The leases are relied upon to prove the existence and consummation of the second part of the unlawful project charged in the petition, namely, the alleged refusal to sell or lease what the petition styles the principal machines, viz., lasting, welt sewing and outsole stitching, heeling, and metallic fastening machines, unless the shoe manufacturer took practically all other machinery from the defendants.

The United States attempted to sustain this charge by contending that the so-called Restricted Use Clause which restricts the use of the machines of one department to use in connection with a machine or machines of another department or departments has this effect. The clause has no such effect, and, furthermore, leases containing this clause are only alternative forms of lease, and lessees have always been able to obtain from the United Company leases not containing such Restricted Use Clauses on terms no higher and in many cases less than were charged by the constituent companies.

The District Court found as to this charge:—

(R. Vol. 1, p. 1162–4.) "The alleged plan of a refusal of what before could be had separately, as a means of compelling the taking of other machines, was a principal ground for invoking the Sherman Act.

"The leases in evidence, as documents, fail to substantiate the charges either as to the contrivance of such a plan or as to its execution. It appears that after the consolidation there was no refusal or imposition of conditions as alleged, but that the defendants continued to give manufacturers terms which were substantially the same as before and in some instances better than those offered by the constituent companies before the consolidation.

". . . As the leases prove no such plan, whether of the extent alleged or of less extent, and as the evidence proves the exact contrary of what is charged, we think that the United Shoe Machinery Company is, upon the merits, entitled to a full clearance from this charge."

In describing the leases the petition also alleges that the United Company discontinued the sale of machines and adopted arbitrary lease and license agreements which "contain provisions, not found in their former lease and license agreements" (R. Vol. 1, p. 997).

The record wholly fails to sustain any such charge. The United Company did not discontinue the sale of machines, for the constituent companies had only leased and never sold any of their machines. The District Court said (R. Vol. 1, p. 1153):—

"An attempt to support this charge by evidence wholly failed. Nothing of the kind was done, nor is it easy to see what grounds for making the charge could ever have been supposed to exist."

Counsel for the United States, in arguing the present case, have not limited themselves to an attempt to prove

the existence and consummation of the unlawful project charged in the petition. They have criticised various clauses, such as the Repair Parts Clause, the Full Capacity Clause, and others, which obviously have no relation to the existence or carrying out of a plan to refuse to lease certain machines unless practically all others were taken. Furthermore, in the District Court they even abandoned the contention that the clauses in the leases which they criticised were adopted with unlawful intent, and they merely contended that the lease system has resulted in an illegal restraint or monopoly and that the intent of the defendants is immaterial. As the District Court said:—

> "At the argument the admission was made on behalf of the United States that there was no proof that at the time they formed the United Company the defendants 'had in mind the adoption of the system of leasing which they later developed.' And the position then taken by the petitioner in argument was that the leasing system referred to has resulted in illegal restraint or monopoly and that the intent which prompted its development is therefore 'absolutely immaterial'" (R. Vol. 1, pp. 1154–1155).

The District Court found (*supra*, pp. 16–17), and the record abundantly proves, that the clauses in question were not adopted with intent to exclude competitors or monopolize, but for the purpose of enabling the lessors to offer the most satisfactory terms to lessees while at the same time they reserved reasonable protection for themselves. The following facts are shown by the record:—

1. From the very beginning of the shoe machinery industry, about 1860, it has been the almost invariable practice in respect to the principal bottoming machines and a common practice as to all shoe machines to lease and not

sell them, and to charge for their use a royalty of a certain amount per pair for shoes on which they are used. This remarkable system under which the shoe manufacturer obtains machines with little or no capital expenditure and pays for them a royalty determined by the amount of use he has for them has proved of enormous benefit to the shoe manufacturing industry and the public.

2. At the time the United Company was formed this lease system was firmly established in the industry and had been proved by experience best suited to the needs of the shoe manufacturer and the machinery manufacturer. The United Company, therefore, not only wished to continue it, but it could not have abandoned the system even had it desired so to do without disastrous and unjustifiable consequences.

3. The clauses contained in the leases of the constituent companies were such as experience had proved were necessary to protect the lessor, who places valuable machinery in the hands of numerous lessees situated all over the country, to be paid for according to the extent it is used.

4. The United Company has not changed the essentials of this system which was employed by the constituent companies. It has from time to time made modifications in the leases, just as the constituent companies had previously made them, in order to meet new conditions, to make its leases conform with one another and to enable it to offer better terms to its lessees. It has also from time to time necessarily adopted new leases for wholly new machines, but these have been similar to the leases already employed. A number of these modifications made by the United Company have removed restrictions contained in the constituent companies' leases which the development of the industry

proved were no longer necessary for its protection. These modifications have been made from time to time, not in pursuance of any plan made in 1899, but only as some special reason arose which made the change advisable. None of these modifications were made for the purpose of excluding competitors. As the District Court found, they were "obviously prompted by the purpose of developing the company's business through the perfectly legitimate method of offering them [the machines] on terms more advantageous to users" (R. Vol. 1, p. 1159). Modifications intended to exclude competitors "would have been different in character from modifications represented by these clauses" (R. Vol. 1, p. 1159).

5. The clauses criticised by the United States are essential to enable a lessor of shoe machinery like the United Company to furnish machines without a substantial initial charge, to be paid for only as used and in other respects upon the best possible terms. In other words, the clauses are essential to a commercially satisfactory leasing system.

The District Court said with reference to the contentions of the United States (R. Vol. 1, p. 1187),—

> "The attack arises from the attempt to adjust the payments to the amount of use which particular manufacturers may have for the patented inventions."

The attack of the United States, therefore, is not upon clauses which are not essential to the maintenance of this system but which could be dispensed with without affecting the terms upon which lessees obtain their machines. The attack is upon clauses which are absolutely necessary to the protection of the lessor under this system, and, therefore, an attack upon the very existence of this system of marketing

shoe machinery upon which the shoe industry is founded, and which has proved so highly satisfactory to shoe manufacturers. To destroy this lease system would be to affect disastrously not only the shoe machinery industry, but also the shoe manufacturing industry, which is founded upon it.

1. THE LEASING SYSTEM.

There are four striking characteristics of the present leasing system. It is these characteristics which have made it so satisfactory to shoe manufacturers and which have resulted in such an enormous development of the shoe manufacturing industry. The clauses in the leases are employed to enable the United Company to offer machines on these favorable terms.

1. Under this system machines are installed in the shoe manufacturer's factory with practically no initial cost.

2. For the use of the machines the lessee is only required to pay a royalty based upon the use which he has for them. If the lessee has no work for the machines to perform he is required to make no payment. It is true that the leases usually contain a guarantee of a minimum payment, but this guarantee is small, is not strictly enforced, and is inserted not to obtain compensation for the machines, but to prevent a shoe manufacturer from keeping a machine indefinitely if he has no work for it to do (see Main Brief, pp. 310–311).

3. A shoe manufacturer who uses a series of machines is given a wholesale or reduced rate. Where a series of machines is used by a shoe manufacturer the cost of caring for each machine is reduced and the royalty received from

each machine is increased. The United Company, therefore, obtains a larger return on each machine at a smaller expense where a series of machines is used and is thus able to offer a wholesale rate in such case.

4. Under the lease system the lessor, who understands the mechanical characteristics of the machines better than the shoe manufacturer, repairs and adjusts the machines, maintains a stock of new parts needed to replace broken parts, instructs operators in the use of the machines, and generally maintains the machines in their most efficient operating condition. By caring for the large number of machines which it has outstanding it is enabled to do this far more efficiently and with less expense than would be possible to the individual shoe manufacturer.

Advantages of Leasing System.

The reasons for the adoption of this lease system and the reasons why it has proved so satisfactory are more or less obvious, but we shall briefly summarize them. For a more extended statement, see our Main Brief, pp. 248–253.

(*a*) Under this lease system a shoe manufacturer does not have to provide the capital necessary to buy outright these expensive machines. As a number of shoe manufacturers testified (see Main Brief, pp. 250, 344–347), machinery of this kind depreciates rapidly and banks are unwilling to lend money on it. Shoe manufacturers can hardly figure as an asset at all such machines as they buy.

Under the lease system the shoe manufacturer is not required to tie up his capital in machinery, but can employ it in buying supplies and producing shoes.

Furthermore, comparatively little capital is necessary in

the shoe manufacturing industry, provided machines can be obtained without capital expenditure. No special factory is required, as any loft which can be readily leased is sufficient. Shoes are made quickly and are sold for cash. The ordinary shoe manufacturer turns over his capital from three to eight times a year (see Main Brief, p. 250.) The business, unlike most manufacturing businesses, can be conducted successfully on a very small scale, as is shown by the fact that in 1911 out of a total of 1,110 operating factories 274 produced less than 100 pairs of shoes per day, 495 produced less than 300 pairs per day, and 636, or more than half, produced less than 500 pairs per day (see Defs.' Ex. 229, R. Vol. 5, p. 441).

The result is that under the leasing system men of very small capital, such as superintendents in shoe factories, are able to enter the shoe manufacturing business on a small scale as independent manufacturers. Many of the most successful shoe manufacturers to-day started with practically no capital, which would have been impossible except under this system.

EDWARD W. BURT, a shoe manufacturer, testified:—

> "As to the effect which it would have had with reference to my ability to go into business at all, I never could have started. I started without any money in shoe manufacturing. I was able to do that because I could obtain my machines by this method.
>
> "That is one of the greatest reasons why I could start in the shoe business—because I could get machinery with practically no expense.
>
> "I know that there are other men who from small beginnings have been enabled to start and grow. I have had experience along that line. I have had two superintendents leave me, both starting in the shoe business. They had practically no money" (R. Vol. 1, p. 741, lines 19–31).

For similar testimony of other shoe manufacturers, see Main Brief, pp. 252, 253.

By thus enabling the man of ability but small capital to enter the business, the United Company has naturally extended and enlarged its business. The two classes of persons who resent this method of leasing machines are, first, certain large shoe manufacturers who are able and would be willing to buy machines outright if they could thus prevent the entry into business and the resulting competition of small manufacturers who are enabled by the leasing system to do business; and, second, competing machinery manufacturers who are not in position or are unwilling to lease machines to shoe manufacturers and wait for their return over a period of years.

(*b*) The art of shoe machinery is still new, and from the beginning it has developed rapidly. A machine may be the best of its kind to-day, but improvements made in a new model a year or two years hence may render it obsolete. Were shoe manufacturers required to buy machines, they would hesitate to invest large amounts of capital in machines which might have to be scrapped shortly afterwards. Persons contemplating entering the business would be deterred by this possibility. Shoe manufacturers who had already purchased machines would hesitate to buy new models or to buy new machines for doing work previously done by hand until they were sure that the new or improved machine was a success and that no further improvements were likely to be made. The shoe industry would thus be greatly retarded.

Under the lease system the United Company takes the risk of the machine becoming obsolete. The shoe manufacturer takes his machine without investing any capital

in it, and, furthermore, confident that if the United Company produces an improved machine, or makes an improvement in the machine already leased, it will give him the new machine or improvement without cost.

(*c*) Under the lease system the shoe manufacturer pays for his machines only as he uses them. If business is poor his royalties proportionately decrease; if good, they increase. The amount of payment is thus automatically adjusted to the amount of business which the shoe manufacturer does, and he is not burdened with heavy annual charges when business is poor. This is especially important to the small manufacturer who has little capital.

(*d*) The principal bottoming machines are delicate, and need constant repair and adjustment. No small shoe manufacturer and few large ones could afford to keep trained mechanics on hand to adjust and repair machines or to keep a sufficient stock of parts on hand to meet emergencies. If machines were sold so that the machinery manufacturer was not vitally interested in maintaining their efficiency, they would get out of repair and become discredited and do far less efficient work.

Where the machinery manufacturer merely leases the machines and is paid by a royalty which is dependent on their being maintained in efficient condition, much more efficient machines result and they give much greater satisfaction to the shoe manufacturer. The machinery manufacturer having a large number of machines to which it gives this service can furnish it better and more economically than the shoe manufacturer himself.

2. OTHER CONSIDERATIONS APPLICABLE TO THE LEASING SYSTEM.

In considering the leases it should be borne in mind that, like the leases of any other property, certain general clauses are necessary, and that it is not intended or contemplated that every clause should be strictly and literally enforced at all times and on all occasions.

For example, take the lease of a house. It frequently provides that no nails shall be driven in the walls, and that the property shall be kept in the same repair as when rented, and that for a breach of these provisions the lessor may evict the tenant. If the lessee drives a single nail into the wall or if a pane of glass is broken and he fails to repair it at once, the lessor may evict him unless the Court intervenes. The lessor, as a rule, does not contemplate that he will evict, nor does he attempt to do so, for a trivial breach of this character. But it is impossible in advance to define in words exactly what is trivial and what is not. The lessor, therefore, necessarily inserts a general clause covering all cases and enforces it only in such cases as at the time appear to be material.

The same is true of the clauses contained in the United Company's leases. For example, the United Company does not plan to cancel the lease if the lessee does not for a short period and for some special reason use some one machine to capacity, or if he uses without the United Company's consent a repair part which happens to be at hand and was not made by the United Company. This is conclusively shown by the record. But the United Company

cannot in words provide in advance for all conditions and define exactly the cases in which it will be materially damaged and entitled to take action. It must reserve general rights. If in certain cases these rights might be enforced harshly and unfairly, this does not condemn them. The question is whether they are inserted for this purpose and are so enforced, or whether they are inserted for a reasonable and proper protection and only enforced when such protection is necessary.

The lease system lends itself easily to fraud on the lessor if the lessee is not honest. The lessor is paid for its principal machines according to the number of shoes made on such machines. Certain machines where the revolutions of a shaft are involved have recording mechanisms which record the revolutions of the shaft but do not record exactly the number of shoes on which the machine is used, and furthermore such mechanisms may be tampered with; other machines, such, for example, as lasting machines, can have no recording mechanism attached. The lessor obviously cannot have a representative in the factory recording the exact use of each machine. It is dependent largely upon the honesty of the reports made to it by the lessee and his operatives. Necessarily it must have clauses which when it is dishonestly or unfairly treated will enable it to take immediate action for its protection.

Under the lease system a relationship far more intimate is created than in the ordinary case of lessor and lessee. The relationship is really a quasi partnership. The United Company furnishes a considerable portion of the shoe manufacturer's capital in the shape of machinery. It gets paid for this only to the extent such machinery is used, or, in other words, as a practical matter, in proportion to the success of

the lessee's business. It, therefore, supplies capital, and, in effect, shares profits. It is almost as interested in the success of the lessee's business as is the lessee. This has the great advantage, from the lessee's point of view, of making it to the interest of the United Company to give him efficient machines and to maintain them in the best possible operating condition. But it means that the United Company necessarily has a right to direct that these machines shall be used in the most efficient manner in order that its own revenue from them may be properly protected.

3. THE LEASES OF THE CONSTITUENT COMPANIES PRIOR TO THE FORMATION OF THE UNITED COMPANY.

As we have stated, the lease system started with the beginning of the shoe machinery industry and was firmly established in 1899, when the United Company was formed.

The leases used by the constituent companies in 1899 are given in Plaintiff's Exhibits 3–13, R. Vol. 3, pp. 22–120.

These leases do not conform exactly to each other—some of them seek to protect the lessor in one way and some in another. A number of these leases at the date of the formation of the United Company, especially the Goodyear leases, required initial payments. The lessee did not take machines under leases requiring substantial initial payments unless he intended to use them, and after he took them he had an interest in using them. These leases requiring initial payments did not necessarily require the same provisions protecting the lessor as the non-initial payment forms.

The following clauses were used in these leases of the constituent companies:—

1. In machines having many moving parts it is essential that the parts be made of proper material, and that they be made for the particular machine in which they are used, so that they will fit perfectly. Experience had shown that if the lessee replaced broken parts with parts obtained from others than the lessor, such parts might not be properly made, might be of inferior material, or might not fit the machine. In such case the machine depreciated in value, returned less royalty, did poorer work, and became discredited.

Every lease of the constituent company, therefore, provided that without the lessor's consent no duplicate parts should be placed in the leased machine except those obtained from the lessor. This is the Repair Parts Clause considered below.

2. Experience had shown that the machinery manufacturer could not afford to develop and construct expensive patented machines and install them in a shoe manufacturer's factory, to be paid for as used, unless the lessee took them for an extended term, and the lessee on his part naturally desired to know that he could retain his machines for an extended period without an increase in royalties.

All of the leases of the constituent companies, therefore, ran for extended periods.

Most of the lasting machine leases ran until cancelled for breach of conditions; in other words, they ran for the life of the machines (P.'s Ex. 6, Art. 9; P.'s Ex. 9, par. 9; P.'s Ex. 10, par. 9). In the case of heeling machines the leases ran for seventeen years and for such further time as any patents embodied then or thereafter in the machines

were in force (P.'s Ex. 11, par. 8). In all other cases the leases ran for the life of the patents then embodied, or which might thereafter be embodied, in the machines. As improvements were not infrequently added to the machines, these leases, as a practical matter, ran indefinitely.

3. Experience had proved that in some cases after the lessor had gone to the expense of constructing and installing a machine and instructing operators in its use the lessee used some other machine permanently or for a time and the lessor's machine was left idle.

This had led the Consolidated Company to adopt a clause requiring the lessee to use the machine to its full capacity so far as he had work for it to perform. This is the so-called Full Capacity Clause. Only in the initial payment lease of the Consolidated Hand Method Lasting Machine was the Full Capacity Clause omitted (P.'s Ex. 8, R. Vol. 3). The initial payment required under this lease was deemed a sufficient guarantee that the lessee intended in good faith to use the machine if he had work for it to perform.

The same situation had led the McKay Company to require that the lessee, if he took its heeling machine, should pay a royalty based on all heels he made, whether or not made by the McKay Company's heeling machines (P.'s Ex. 11, par. 3). This is the so-called Factory Output Clause, used in one alternative form of lease of Goodyear machines.

4. Experience had shown the Consolidated Company that if it went to the expense of installing a machine without initial payment it met with two difficulties: first, the lessee might last his shoes largely or wholly by hand or if the machine were used, the company might not receive

sufficient royalty from one machine to recompense it; and, second, the lessee might obtain another machine of the same kind, and, although he used the Consolidated Company's machine to a considerable extent or entirely, he might dishonestly report that much of the work was done on the other machine, or he might use the Consolidated Company's machine only upon slow or difficult work and the other machine for quicker or easier work, in either event depriving the lessor of a fair return. The Consolidated Company met the situation by requiring the lessee to take additional machines for any additional work he might have, thus requiring an exclusive use of its machines of the kind leased (see P.'s Ex. 6, Art. 12; P.'s Ex. 7, par. 12; P.'s Ex. 9, par. 12; P.'s Ex. 10, par. 12).

This is the so-called Additional Machinery Clause, the only clause which ever appeared in any of the United Company's leases requiring the taking or use of any machine in addition to the particular machine covered by the lease. This clause was used only to a slight extent by the United Company and was eliminated completely from all leases put out after 1907 (see Main Brief, pp. 323–326).

The Goodyear Company, in its turn leases, although it charged an initial payment, had deemed it necessary, for the reasons outlined above, to require an exclusive use of its turn machines (P.'s Ex. 3, par. 6; R. Vol. 3, pp. 25–26). This clause was eliminated by the United Company in December, 1900 (see Main Brief, p. 281).

5. The McKay Company, to protect itself against the possibility of not obtaining a fair return where the lessee provided himself with other machines of the same kind for his work, either because of dishonest reports on the part of the lessee as to the use of its machines or because the

McKay Company's machines were in such case used only on slow or difficult work or were only used during the lessee's busy season, adopted a clause which did not require the lessee to take additional machines and thus use its machines exclusively, as in the case of the Additional Machinery Clause, but which permitted the lessee to use other machines and merely reserved an option to the McKay Company to withdraw its own machines in such case. This is the so-called Exclusive Use Clause which has been employed by the United Company and which the United States attacks.

6. The Goodyear Company, which had developed its welter and stitcher for use together, both being essential to the integrity of its Goodyear welt shoe, leased them for a single royalty and provided that if either were used on any shoe both should be used. In other words, it restricted them to use together.

Its auxiliary machines it had developed from time to time and had leased to lessees of its principal machines without requiring any additional royalty. It thus increased and improved the work done by the principal machines and enhanced the reputation of the Goodyear shoe. It did not charge a separate or additional royalty for these auxiliary machines, because it wanted to encourage lessees to use them and thus improve the quality and reputation of the Goodyear shoe. But the Goodyear Company could not lease these machines without royalty unless they were used on shoes on which its principal machines for which a royalty was paid were also used. The Goodyear Company, therefore, restricted these auxiliary machines to use on shoes on which its principal machines were used. In other words, the entire group of Goodyear machines was treated

as a unit and a single royalty was charged. But the lessee was not required to take or use the auxiliary machines and he was entirely free to use auxiliary machines obtained from others with the Goodyear Company's welter and stitcher.

This clause restricting the use of the auxiliary machines is the Auxiliary Restricted Use Clause, which has been continued by the United Company.

For a fuller statement of the reasons for adopting the Auxiliary Restricted Use Clause, see *infra*, pp. 151–154; also Main Brief, pp. 375–378.

7. The Goodyear Company put out the Ideal Lasting Machine as well as its Goodyear machines. This machine was invented and adapted for use with the Goodyear welter and stitcher. A separate royalty was charged for its use, but it was restricted to use on shoes on which the Goodyear Welter and Stitcher operated. The Goodyear Company, by thus adding it to the series of Goodyear machines which it was already caring for and placing it only in factories in which it had these other machines, was able to care for it at less expense and to charge less for the Ideal machine than would otherwise have been possible and was also able to maintain the machine in efficient working condition and thus maintain its reputation.

The clause by which the Ideal machine was so restricted is the Restricted Use Clause criticised by the United States. As employed by the United Company in its leases of various machines, it is only an alternative clause. The machines of each department are also leased at the option of the shoe manufacturer on independent unrestricted leases.

8. All of the leases contained a provision reserving to the lessor the right to cancel the lease if the agreements on the

part of the lessee were broken, thus enabling the lessor to protect itself against future and additional damage.

9. In addition to the foregoing clauses certain other clauses were contained in the different leases, among others the following:—

(*a*) It was provided in certain leases that the lessor might cancel if the machines were unused for a certain length of time (P.'s Ex. 7, par. 8; P.'s Ex. 9, par. 8).

(*b*) In certain leases the lessee guaranteed a minimum royalty (P.'s Ex. 7, par. 3; P.'s Ex. 9, par. 3).

(*c*) In one of the leases the lessor was given the right to cancel the lease if the machine was not used sufficiently to earn a certain royalty within a given period (P.'s Ex. 6, par. 8).

(*d*) The Consolidated Company had found that its machines were sometimes taken for the purpose of enabling the lessee to beat down the wages paid hand-lasters, or for the purpose of enabling it to get better prices from some other shoe machinery manufacturer. Most of its leases, therefore, provided that the leased machines should not be used, "as a means of reducing the price of hand-lasting, nor to control hand lasters, or to influence any trade in connection with any other lasting machines not controlled by the licensor, or the price list for lasting thereon" (P.'s Ex. 6, Art. 12; P.'s Ex. 7, par. 12; P.'s Ex. 9, par. 12; P.'s Ex. 10, par. 12).

4. MODIFICATIONS MADE IN THE LEASES BY THE UNITED COMPANY.

The United Company, as we have stated, could not have changed the essentials of the lease system even had it so desired without throwing the entire shoe machinery industry of the country into confusion. It could not have recalled and cancelled the outstanding leases without the consent of the lessees, which it could not have obtained. As to all machines then outstanding it was obviously necessary to continue the system. The great majority of shoe manufacturers did business on a small scale and had comparatively little capital. They had been induced to enter the business by the offer of machines upon the lease system. Had the United Company refused to furnish additional machines on this basis it would have seriously crippled many of the lessees and worked a great injustice. On the other hand, if it did continue to furnish machines on the existing basis, it was essential that it continue the clauses which experience had shown were necessary for the protection of the lessor or similar clauses.

Apart, then, from the fact that the lease system had proved itself best adapted to the needs and conditions of the shoe machinery business, the United Company found itself practically pledged to its continuance.

The United Company has not changed the essentials of the system at all. For over a year it made no changes whatsoever in the leases, but simply used the same forms of lease employed by the constituent companies—a proof

that the United Company was not formed for the purpose of changing the leases, in which case such changes would have been made at once. When it did from time to time thereafter make modifications they were only made in new leases. Outstanding leases were not disturbed (see Main Brief, pp. 273–274).

A certain number of modifications were introduced for the purpose of making the leases consistent; some eliminated restrictions employed by the constituent companies which in the course of time proved unnecessary; other modifications were gradually introduced to enable the United Company to meet new conditions and offer better terms to its lessees.

The District Court said (R. Vol. 1, p. 1158),—

> "Regarding the various modifications so introduced, it may be said in general that they tended to relax previous restrictions upon the use of leased machines, and to reduce the cost to the lessee of installing them."

The United Company has, at the option of the shoe manufacturers, sold outright without restrictions all but one of the General Department machines which it has gradually developed and acquired. It has thus departed in this respect from the policy of the constituent companies, which only leased machines.

The United Company eliminated in 1900 the provision in the Goodyear Company's lease requiring an exclusive use of the Goodyear Company's turn machinery. It employed the Additional Machinery Clause only to a slight extent and eliminated it entirely in all leases put out after 1911 (see Main Brief, pp. 323–326).

In order to make its leases consistent and to have them

run for a definite period, the United Company has introduced a seventeen-year term in its leases. This has not increased but in most cases reduced the term used by the constituent companies. The Full Capacity Clause used by the constituent companies in a number of leases has been used in all leases of machines for which a royalty based on use instead of a fixed royalty is charged. The Exclusive Use Cancellation Clause previously used by the McKay Company has been substituted for the Additional Machinery Clause, and is generally used in leases of machines for which a royalty based on use is charged.

The formation of the United Company resulted in its furnishing a series of machines of different kinds or departments instead of having the same furnished by different companies. Where the machines of different kinds were used as a series, the result was that each machine could be cared for more efficiently and more economically and each machine produced a larger royalty. The United Company was, therefore, enabled from time to time to reduce its charges for machines so used as a series, and thus share with its lessees the economies and increased revenues which resulted from such use. It effected this reduction to a large extent by eliminating initial payments where machines were taken for use as a series. Where such a reduction was made because a machine was to be used as part of a series, it was, of course, necessary to provide that the machine should be used in the manner agreed upon, and the United Company, therefore, introduced into such leases the so-called Restricted Use Clause, providing that machines taken for use as a series should only be used in this manner. This was the method employed by the Goodyear Company in leasing its Ideal machine.

A lease which did not contain this Restricted Use Clause was offered lessees as an alternative.

The Restricted Use Clause was not introduced immediately upon the formation of the United Company but only from time to time as some reduction in price or terms was effected.

These changes or modifications did not change the essentials of the leasing system in effect at the date the United Company was formed.

5. EXAMINATION OF THE LEASE CLAUSES OBJECTED TO.

A. Repair Parts Clause.

The United Company's leases provide that the lessees shall obtain from the United Company all duplicate parts needed to repair the machines.

The leased machines belong to the United Company. When a part is replaced, the new part, of course, belongs to the United Company. Unless such new part is adapted for use in the machine and is of equally good material as the part it replaces, the machine will not only depreciate in value, but might be seriously damaged, and it will do less efficient work and return less royalty. It is absolutely essential to the lessor that it control the character of the parts placed in its own machines. The United Company could properly provide that all repairs on its own machines should be made by itself, and in such case could, of course, use its own parts. As this in some cases might delay the repair of the machine, the lessee is authorized to make

repairs, provided he uses parts obtained from the United Company and which it knows are of proper construction and will fit the machine.

The petition does not allege that this clause is unlawful, but it alleges that the United Company has charged exorbitant prices for these parts and thus oppressed its lessees (R. Vol. 1, p. 997). Not only did the United States utterly fail to prove this allegation, but the defendants disproved it (see Main Brief, pp. 299–302). The District Court held that there was no evidence justifying this allegation (see Main Brief, p. 55).

B. Return Charge Clause.

The petition charges that the United Company exacted a return charge at the termination of the leases, which in some cases amounted to approximately the original cost of building the machines.

No evidence was introduced to substantiate this charge. On the contrary the defendants showed that in the year 1911 the cost of repairing returned machines was approximately $350,000 and the charges to lessees only about $70,000, showing a loss of $277,763.49 (see Main Brief, p. 302). This is only another example of the unfounded charges made by the United States.

C. Seventeen-Year Term.

The adoption of this term by the United Company reduced the term employed in most cases by the constituent companies (see Main Brief, pp. 302–306). It,

therefore, affords no evidence of an intent to obtain a monopoly by new methods as charged in the petition. It was obviously adopted to make the various leases consistent and to make them run for a definite term instead of indefinitely as was the case with most of the constituent companies' leases.

A long term is essential both from the point of view of the lessor and of the lessee. The United Company constructs millions of dollars' worth of machinery which it places in its lessees' hands without initial payment. It can only do so if the lessee will agree to take and use the machinery for an extended period so that the resulting royalties will compensate for its investment.

A shoe manufacturer also requires an extended period. He embarks in business on the strength of obtaining patented machinery without initial cost. He desires an assurance that he may retain this machinery without an increase in royalties. An agreement on the part of the United Company to permit a shoe manufacturer to retain its machines, and not to raise its royalties for a period of seventeen years, although the cost of machines may increase very largely, is certainly of advantage to shoe manufacturers.

If a rival shoe machinery manufacturer finds that the execution of these leases makes it more difficult for him to furnish machines, to what is this due? Obviously it is due to the fact that the rival finds that shoe manufacturers have already obtained machines to perform their work; that their needs are, therefore, largely satisfied; and that the market for practical purposes is limited to furnishing machines for additional work and to furnishing machines to new manufacturers just entering business. But this

is the field to which the manufacturer of practically every commodity is limited, that is, to supplying new needs.

If the leases ran for shorter terms,—say for ten or twelve years,—a competitor would find himself in the same position. Indeed, if the machines had been sold to shoe manufacturers outright, the competitor would be little if any better off. Shoe manufacturers who purchased machinery would not discard it until it became obsolete or worn out. Their demands for new machinery would for practical purposes be limited to their requirements for additional machines.

The difficulty the competitor finds, then, is not that these leases run for seventeen years instead of, say, for twelve years, but that existing shoe manufacturers are supplied with the machinery they require so that the demand for additional machinery is limited.

To contend that every shoe manufacturer must be left free to terminate his leases with the United Company and discard its machines without obligation to the United Company is to contend that no leases except those terminable at will can be made. But to so hold is to deny the right to contract at all.

As said by this Court in *Coppage* v. *Kansas*, 236 U. S. 1 (p. 21):—

> "For constitutional freedom of contract does not mean that a party is to be as free after making the contract as before; he is not free to break it without accountability. Freedom of contract, from the very nature of the thing, can be enjoyed only by being exercised; and each particular exercise of it involves making an engagement which, if fulfilled, prevents for the time any inconsistent course of conduct."

In *Chicago, etc., R.R. Co.* v. *Pullman Car Company,* 139 U. S. 79, this Court held lawful a contract under which the Pullman Company was given the right for fifteen years not only to furnish parlor cars on the railroad company's line, but to furnish them exclusively on the existing line and on any other lines thereafter owned by the Railroad Company. The Court said (p. 89):—

> "We cannot perceive that such a contract is at all in restraint of trade."

There is absolutely no evidence in the record that this clause has ever been used to oppress lessees. Although the United Company has the right to require under the letter of the lease a lessee to retain his leased machine for seventeen years, it has always waived this right by furnishing the lessee with any new or improved machine which it developed without additional charge of any kind (see Main Brief, p. 306).

It has also been ready to permit a shoe manufacturer to cancel his leases if circumstances justified. Thus Mr. McElwain, whose company is one of the largest shoe concerns in the country, was told that he might cancel his leases if he desired to use other machines (R. Vol. 1, p. 502, lines 12–18).

It is alleged that the term of the leases runs beyond the term of the patents. If true this would be immaterial, as the agreement that it shall run for seventeen years is a normal business agreement, and is not dependent on the fact that the machines are patented. But as a practical matter it has never been true. The machines have been so constantly developed that most of them contain inventions covered by applications for patents, which when is-

sued will run beyond the term of the lease, and the machines are usually improved by some invention after they are leased. The result is that in no case does it appear that unpatented machines are held under the leases.

The record then shows that the adoption of the seventeen-year term actually reduced the term required by the constituent companies; that an extended term is a benefit to both lessor and lessee; and that there is not the slightest evidence that the term was adopted or used to oppress shoe manufacturers.

D. Full Capacity Clause.

The Full Capacity Clause requires the lessee of a machine to use such machine to its full capacity upon all shoes made by the lessee upon which it can be used.

The reason for this clause is obvious.

The lessor invests its money in a valuable machine, installs it in the lessee's factory, and instructs the lessee's operatives, relying for his return on a royalty paid on each pair of shoes on which the machine is used.

But unless the lessee uses the machine the lessor will get no return. The agreement to use the machine is absolutely necessary if the machine is to be leased on this basis.

It seems obvious that the lessee cannot complain of this clause. If he does not intend to use the machine for such work as he may have for it, he has no right to take it under a lease whereby he is required to pay only if the machine is used. If he does intend to use the machine for his work, there is no reason why he should not agree to do so.

Nor can a competitor of the United Company complain. He has no right to demand that a shoe manufacturer taking

machines from the United Company shall be as free to deal with him as if such lease had not been made. If the machines were leased for a fixed rental, which even the United States admits would be lawful, such competitor would not find it any easier to dispose of his own machines, for the lessee would use the machines for which he was paying rental, and not those taken from a competitor for which he would be obliged to make an additional payment.

That the Full Capacity Clause was inserted only for the purpose of assuring the lessor a return from machines leased for a royalty dependent on the number of shoes on which they are used is conclusively shown by the fact that this clause is not used in respect to machines for which no royalty based on the number of shoes operated on is charged (see Main Brief, p. 312).

The United States apparently insists that a fixed rental or monthly rental would be equally satisfactory. Such is not the case. If a fixed rental were charged, the shoe manufacturer would be required to pay the same amount, whether business was good or bad. Furthermore, if he changed the character of his work he would be subjected to a disadvantage. If, for example, in one year he made 1,000 pairs of McKay shoes per day and had McKay lasting machines for this purpose, and the next year he made 750 pairs of welts and only 250 pairs of McKays a day, he would be required to pay for his McKay lasting machines exactly the same amount as during the previous year when he used them four times as much. Under the present system his McKay lasting royalties would be reduced three-fourths.

Again, under a fixed rental the small shoe manufacturer would be placed at a distinct disadvantage. 25 per cent.

of the United Company's lessees make less than 100 pairs per day (R. Vol. 1, p. 454, line 45; p. 455, line 1). If a machine having a large capacity, as most of them have, were leased for a fixed rental, a small shoe manufacturer making 100 pairs per day would pay for its use on each pair of shoes many times the amount paid by the large manufacturer who used it to capacity.

It is obvious that this clause is essential if machines are leased to be paid for only to the extent they are used. To eliminate this clause would, as a practical matter, prevent the further employment of this highly beneficial method of charging for the use of the machines.

For a more complete discussion of the Full Capacity Clause, see Main Brief, pp. 307–312.

E. Additional Machinery Clause.

The Additional Machinery Clause required the lessee to take from the lessor additional machines of the same kind as those leased if his work required it.

As we have shown above, it was used by the Consolidated Company to assure it a proper return on its investment and to protect it against receiving a return not fair to it by the use of other machines of the same kind (*supra*, pp. 89–90). As it was used only to a very slight extent by the United Company and eliminated from all its leases by 1907, four years before this suit was brought, it is of no importance in the present case except as showing that the United Company eliminated from the lease system the only clauses obligating the lessee to take any additional machines.

For a discussion of this clause, see Main Brief, pp. 323–326.

F. Exclusive Use Cancellation Clause.

When a machinery manufacturer installs his machine in a shoe factory to be paid for by charging a royalty for each pair of shoes on which it is used, he runs a risk of not getting a fair or proper return when the lessee uses another machine of the same kind for the following reasons:—

1. The lessor, in order to obtain his stipulated royalty, must know how many pairs of shoes are operated on by his machine. He cannot afford to employ an inspector to watch the machine all the time. On certain machines he can place a recording mechanism which roughly shows the amount of use, but this may get out of order or be tampered with. On other machines, such as lasting machines, no such recording mechanism is practicable. The lessor must, therefore, depend for the most part on the reports made to him by the lessee and his operatives. When another machine of the same kind is used, the lessor may have good reason to believe, though absolute proof is difficult, that many shoes made on his machine are reported either carelessly or dishonestly as made on the other machine.

2. The shoe business is seasonal. A shoe manufacturer having an average production of 1,000 pairs per day will at certain seasons make 2,000 pairs per day and at others 500. He must be provided with an equipment sufficient to make 2,000 pairs per day, although he uses this capacity only for a short period in each year (see Main Brief, p. 255).

If a shoe manufacturer leases a machine on a royalty basis and then obtains another machine of the same kind elsewhere, he may use the leased machine only in the busy season, thus paying only a small annual royalty for it, and use the other machine during the entire year.

3. Work on different types of shoes varies; some shoes can be operated on much quicker than others. A lessee having two machines of the same kind may use one machine on slow work and thus incur a comparatively small royalty payment which does not compensate for the machine, and do his quick work on the other machine.

It is obvious that a lessor of a machine under the royalty system must protect himself so as not to be deprived in the above ways of a fair return where other machines of the same kind are used by the lessee.

As we have stated above, the Consolidated Company protected itself against these dangers as well as others by requiring an exclusive use of its machines of the kind leased (*supra*, p. 90). The Goodyear Company also required an exclusive use of its turn machines (*supra*, p. 90). The McKay Company protected itself by providing that if the lessee supplied himself with other machines of the same kind for his work it might withdraw its own machines (*supra*, pp. 90–91).

The United Company, as a result of its experience, determined that it was not necessary for its protection to require an exclusive use of machines of the kind leased, and, therefore, gradually eliminated from the lease system the additional machinery clause requiring such exclusive use, and adopted instead the clause used by the McKay Company.

This clause is referred to in the briefs as the "Exclusive Use Cancellation Clause." The use of the word "Exclusive" is perhaps misleading in that it may imply that the lessee is required to use the United Company's machines of the kind leased exclusively. Such is not the case, in spite of the insistence of the United States. The clause

does not obligate the lessee to use any machines whatsoever of the United Company. On the contrary, it recognizes the right of the lessee to use other machines and permits him to do so if he chooses. It merely gives the United Company an option in such case to withdraw its own machines of the same kind.

It must further be borne in mind that the clause only permits the United Company to withdraw a machine where another machine of the same kind is used. For example, the United Company may withdraw its lasting machines if other lasting machines are used by the lessee, but it cannot for this reason withdraw its Goodyear, metallic, heeling, General Department, or any other types of machines.

Not only does this clause recognize the right of the lessee to use the machines of others, but in employing this clause it was not the intention of the United Company to exercise its option to withdraw its own machines merely because other machines of the same kind are used. The purpose of the United Company is merely to reserve this right in case, owing to the use of other machines of the same kind, the United Company, for this reason, is deprived of a fair return on its own machines.

Mr. Winslow testified:—

> "The purpose of the Company has been nothing more than to reserve to the Company the right to cancel leases of machines of a type which the lessee had ceased to use exclusively, if conditions became too onerous to continue them" (R. Vol. 1, p. 47, lines 18–21).

It is difficult to see how this clause restrains trade or compels a use of the United Company's machines. The lessee of heeling machines, for example, is free to use any

other heeling machines he pleases. If he prefers a competitor's heeling machine and uses it and the United Company exercises its rights under this clause and withdraws its own heeling machine, this only leaves the lessee free to use the competitor's heeling machine which he prefers. The clause, therefore, cannot compel the shoe manufacturer to use the United Company's machines.

The competing machinery manufacturer will be actually benefited by the enforcement of this clause. If the United Company withdraws its machines, the business naturally goes to the competitor.

Had the United Company intended to compel an exclusive use of its machines, it would have so provided. It surely would not have eliminated from its leases the Additional Machinery Clause, which required such exclusive use and substituted the right to withdraw its machines, which expressly recognizes the lessee's right to use other machines.

That the clause is merely intended to permit the United Company to withdraw its machines because it does not receive a fair royalty, due to the use of other machines, is further shown by the fact that the clause is not employed with reference to machines for which a fixed rental is paid whether or not the machines are used. It is not necessary in these leases, because the use of other machines cannot affect the amount of compensation paid the United Company (see Main Brief, p. 317).

If this clause could in any way be so enforced as to exclude competitor's machines, or to compel a use of the United Company's machines (which we deny), the record fails to show a single instance in which it has been so enforced.

We submit that the record conclusively shows that this clause was adopted for the purpose of affording a reasonable and proper protection to the lessor; that it cannot be exercised so as to compel an exclusive use of the United Company's machines; and that the United Company has never attempted to enforce it for this purpose. There is, therefore, no ground for contending that it is unlawful in itself or that it evidences an unlawful intent.

Furthermore, the United Company is under no obligation to permit any shoe manufacturer to use its patented machines. When a shoe manufacturer requests the United Company to install its heeling machines, for example, in his factory, the company is absolutely free to refuse for any reason whatsoever. If it does consent to install its machines and licenses the shoe manufacturer to use them, it is free to permit such use for such period, long or short, as it in its sole discretion determines advisable. Having the right to refuse any use whatsoever, it cannot be criticised for limiting the term of such use. Therefore, in permitting the use of its machines until it determines to withdraw them, it is wholly within its rights, no matter what the reasons for or the effect of such withdrawal (see Main Brief, pp. 320–323).

G. Cancellation for Breach Clause.

This clause permits the cancellation by the lessor of all leases between the lessor and the lessee, provided, and only provided, the lessee violates a condition in one or more of such leases "expressed to be obligatory upon the lessee"; in other words, some condition which the lessee obligates himself to carry out.

This clause, therefore, merely provides that if the lessee does not act in good faith, but violates his agreements by refusing to pay royalties or taxes, by abusing the machines, by failing to use them to capacity when he has work for them to perform, or by otherwise acting contrary to his undertakings, the United Company may at its option sever relations with him.

The leases of the constituent companies all contained provisions giving the lessor the right to cancel if the lessee violated the lease. Practically every lease of property has such a condition.

Counsel for the United States apparently objects to the present clause because it permits the cancellation not only of the particular lease the agreement in which is broken, but of all other leases between the parties. The United Company could perfectly well furnish all its machines on a single lease, as did the constituent companies prior to the formation of the United Company, and if it did so this objection of the United States would not be applicable. For convenience it issues different leases for machines of different departments and new leases when new machines are taken, but the relationship between the United Company and a lessee is essentially a single relationship which is expressed for convenience in a number of different leases. If the lessee violates an agreement in any one of these documents which warrants any cancellation, it is as fair to cancel all as it would be to cancel that particular one.

It is impossible to see how this clause can restrain trade or tend to create a monopoly. The shoe manufacturer cannot complain if he loses his leases because he violates his agreements. A rival shoe machinery manufacturer cannot complain of the exercise of this clause because he

is obviously benefited if a shoe manufacturer is deprived of machines by the United Company and, therefore, must seek his machines elsewhere.

The United States further contends that this clause is unlawful because it permits the United Company to withdraw all its machines if the lessee violates the Full Capacity Clause or the Restricted Use Clause. The contention is that a lessee will not use a competitor's machine in violation of the Full Capacity Clause or the Restricted Use Clause if he thereby runs the risk of losing all his machines taken from the United Company.

But surely this argument does not show the Cancellation Clause to be unlawful. The argument depends wholly upon whether the Full Capacity Clause and the Restricted Use Clause are lawful. If they are lawful, then it is obviously fair that the lessee should be bound by them, and if he chooses to violate them that his leases should be cancelled. The right to cancel for violation of agreements by the lessee can under no circumstances be unlawful if it is proper to exact such agreements from the lessee.

Furthermore, if it were possible to exercise this right of cancellation so as to oppress lessees, the record fails to show any such instance.

The record fully sustains Mr. Winslow's testimony that the clause was inserted only to permit the United Company to sever its relations on account of conduct by the lessee which "in the ordinary business relations between men would make continuance of the relations impossible" (R. Vol. 1, p. 447, lines 22–34). In only five cases (apart from bankruptcy) have leases been cancelled. In each of these cases the lessee either had abandoned the use of the United Company's machines entirely or was persistently cheating

the United Company of the royalty due on its machines (see Main Brief, pp. 429–430).

The United States has contended that this Cancellation Clause, taken in connection with the Exclusive Use Cancellation Clause, considered *supra*, p. 105, permits the United Company to cancel all its leases if its machines of a particular kind are not used by the lessee exclusively. But this is obviously not true. This Cancellation for Breach Clause which we are now considering permits cancellation only for violation for a condition "expressed to be obligatory upon the lessee." The Exclusive Use Cancellation Clause does not obligate the lessee to use the United Company's machines exclusively or at all; it merely reserves an option to the United Company in such case to cancel its leases of certain machines if other machines of that same kind are used. As the lessee is not obligated to use machines of the kind leased exclusively, the provision is not a condition "obligatory upon the lessee;" there is no agreement to "breach" or "violate;" and, therefore, the use of other machines gives the United Company no right to cancel all its leases or any of its leases under this Cancellation for Breach Clause.

H. Restricted Use Clause.

The United States contends that this clause was adopted to force a shoe manufacturer desiring to take one type of machine to take other kinds. It was relied on to prove the basic charge in the petition that the defendants formed an unlawful plan to refuse to lease any essential machines, unless the shoe manufacturer took practically all others from it.

The clause as employed by the United Company is so totally unadapted to accomplish this result as to show it has no such effect, and was adopted for no such purpose.

(1) Wording of the Restricted Use Clause.

The Restricted Use Clause provides that a machine of a certain kind or department shall not be used on any shoe on which certain other operations are performed by machines not leased from the United Company. For example, in the lease of the hand method welt laster, the clause provides that the leased lasting machine shall not be used on shoes the soles of which are welted or stitched on machines not leased from the United Company (P.'s Ex. 15, R. Vol. 3, p. 129 at p. 131).

The clause does not obligate the lessee to use any of the United Company's machines. It does not require the lessee to use the lasting machine taken under the lease or the United Company's welter and stitcher. It merely provides that if the lessee does use the lasting machine it shall not be used on shoes which are welted or stitched except on machines leased from the United Company. In other words, it provides that the lasting machine, being taken for use with the welter and stitcher, shall be so used.

If the lessee desires to use a competitor's lasting machine he is free to do so. If he desires to use a competitor's welter and stitcher he is also free to do so. The only restriction is that if he does use an outside welter and stitcher he shall not use the leased lasting machine on shoes on which the outside welter and stitcher are used. If he wishes to use the lasting machine in connection with such

outside welter and stitcher he may exchange his restricted lease for an unrestricted lease by making an initial payment of $300.

(2) Reasons why a Lower Rate can be Offered where Machines are Taken for Use as a Series.

As we have stated, the Restricted Use Clause was adopted to enable the United Company to offer certain of its machines at lower rates where they were taken to be used as part of a series.

It is of the utmost importance to understand clearly the reasons why the use of the United Company's machines as a series reduces the cost of caring for each machine and increases the royalty received from each machine and thus makes it possible for the United Company to offer a reduced rate where its machines are used as a series. We beg the Court to read carefully the explanation in our Main Brief, pp. 339–343. We shall summarize the reasons here.

1. A series of different machines is used in making each shoe. If any one machine of the series is poorly constructed, or not properly cared for, so that it does poor work or breaks down, work on the entire series is stopped, and, as the royalty for each machine is based on its use, each machine when not used ceases to produce royalty for the lessor.

When a machine which is not properly cared for and frequently breaks down is introduced into the series, the lessor of other machines necessarily suffers as his royalties are reduced.

> "The productive efficiency and quality of work done by any line of machines is only equal to that of the least efficient machine in the line" (R. Vol. 1, p. 857, lines 26–28).

As the United Company furnishes the best machines made and is practically the only shoe machinery manufacturer which furnishes efficient service (R. Vol. 1, p. 867, lines 32–35) if its series of principal machines is not used, each machine which is used necessarily produces less royalty.

2. We have described above the character of the service rendered by the United Company with its machines (*supra*, pp. 59–63). It is obvious that the cost of this service per machine is less where a series of machines is located in one factory than if the same number of machines were leased separately and scattered through different factories.

3. The United Company's machines are adapted for use together. This is a matter of vital importance. For example, the lasting machine must prepare the work for the welt machine and leave it in such condition that the welt machine can operate on it. Improper operation of any machine of the series may impair the efficiency of the operation of a number of the other machines of the series (see Main Brief, pp. 333–340).

It is obvious that the interjection into a series of the United Company's machines of a machine not adapted to be used with the rest of the series will result in poorer work and less work and therefore less royalty for the United Company.

4. The United Company furnishes the best machines made, as the District Court found (R. Vol. 1, p. 1137). When an inferior machine is used with its machines, especially a machine not particularly constructed for use with them, poor work is likely to follow. It is often extremely difficult in such case to determine which of a series of machines is responsible for the poor work (see Main Brief,

pp. 338–339). The use of an inferior machine as part of a series is likely to discredit the other machines of the series, although they are not responsible for the defective work which results.

The foregoing conditions show beyond question that when a series of the United Company's machines is used, the total number of shoes operated on by each machine is increased, and, therefore, the amount of income on each royalty machine is proportionately increased; that the cost of caring for each machine is reduced, the reputation of the machines is maintained, and the regularity and certainty of output is assured.

These results clearly justify the United Company (if any justification is needed) in granting the shoe manufacturer who uses a team or series of the United Company's machines a better rate than is granted a shoe manufacturer who uses a single machine out of the series or only a portion of the series.

This is all that the Restricted Use Clause accomplishes. It enables the shoe manufacturer to share in the economies and increased return which result where he uses a series of machines.

(3) Contentions of the United States with respect to the Restricted Use Clause.

We do not understand that the United States denies that economies result from the use of a series of the United Company's machines. Its contention, as we understand it, is:—

1. That the Restricted Use Clauses compel a shoe manufacturer taking machines of one department or type to

take also machines of another type or types and that they are for this reason inherently unlawful.

2. That even if this is not so, the Restricted Use Clauses were adopted with intent to exclude competitors, and, therefore, are unlawful, or evidence an unlawful intent.

(4) Contention that the Restricted Use Clause Compels a Shoe Manufacturer using One Type of Machine to Use Other Types.

Even if it were true that by the Restricted Use Clause a shoe manufacturer could not use one type of machine, for example, lasting machines, obtained from the United Company unless he used other types of its machines, such, for example, as its welter and stitcher, this would, as we show below, not make the clauses unlawful.

The owner of a series of machines adapted for use together is not required to permit their use separately. He is fully within his rights if he only permits the use of the entire series and refuses to permit the use of a part of the series (see *infra*, pp. 136–151).

But the entire contention of the United States that the Restricted Use Clause compels a shoe manufacturer desiring to use one type of machine to use other types is based on a false assumption, viz., that the shoe manufacturer can only obtain restricted leases.

This, as we have stated, is not true. The United Company has always been willing to lease its machines of any department under unrestricted leases. A shoe manufacturer, therefore, who desires to use the United Company's lasting machines and who does not wish to use its

welter and stitcher is not compelled to do so. He can take the United Company's lasting machine on an unrestricted lease, making an initial payment.

The entire argument of the United States that the United Company compels a shoe manufacturer taking one type of machine to use other types is, therefore, without foundation and the District Court therefore very properly held that the United Company was "upon the merits, entitled to a full clearance from this charge" (*supra*, p. 76).

(5) Contention that the Initial Charges for Unrestricted Leases are Prohibitive.

To meet the fact that a shoe manufacturer can obtain unrestricted leases if he so desires, the United States contends that the charges for unrestricted leases are so large as to be prohibitive.

The royalty charged under unrestricted leases is in practically every instance the same as the royalty charged under restricted leases. The only difference is that an initial payment is charged for an unrestricted lease (see Main Brief, p. 359).

The United States introduced absolutely no evidence that such initial payments were unreasonable or prohibitive. It did not even show what relation these initial payments bear to the value of the machines. Counsel for the United States to prove its contention relied on the fact that most shoe manufacturers prefer and take the restricted leases. This fact, it contended, shows that the unrestricted leases are prohibitive.

The District Court found, and the record shows, that the United Company's machines are the best machines

made, that they are constructed for use together, and that no other manufacturer of machines furnishes adequate service with them. It is, therefore, not strange that most shoe manufacturers use a series of the United Company's machines; and, since apart from any other reasons they prefer to use such a series, it is not strange that they take advantage of the wholesale rate offered where such a series is used, and, therefore, hold restricted leases. This certainly affords no evidence that the charges for the unrestricted leases are prohibitive.

That such charges are not prohibitive is shown, first, by the fact that they are the same charges that were made by the constituent companies, and, second, by the comparatively large number of unrestricted leases which are actually taken by shoe manufacturers.

As the District Court found, the United Company continued to offer on unrestricted leases and on terms which were as favorable and in certain cases more favorable than those offered by the constituent companies, the various machines previously furnished by the constituent companies, although the cost of building machines has increased, the United Company's machines have been much improved, and it furnishes far more efficient service and a larger number of auxiliary machines.

As shoe manufacturers had paid the rates demanded by the constituent companies for many years prior to the formation of the United Company, it can hardly be contended with reason that more favorable rates are prohibitive.

The extensive use of unrestricted leases also shows conclusively that the initial payments are not prohibitive. For example, shoe manufacturers took, during the twelve years from the formation of the United Company up to

1911, 869 unrestricted leases of the Hand Method McKay lasting machine alone. In 1905 there were outstanding 186 unrestricted leases of principal metallic machines, 536 unrestricted leases of heel-attaching machines, and 322 unrestricted leases of lasting machines (see Main Brief, p. 364). In 1911 there were 225 metallic machines, 415 principal heel-attaching machines, 514 auxiliary heeling machines, and 1,506 lasting machines held on unrestricted leases (see Main Brief, p. 364).

This extensive use of the unrestricted leases proves conclusively that they are not prohibitive, as the United States contends.

The United States at the first argument in this Court laid considerable stress on the testimony of F. C. Rand, vice-president of the International Shoe Company, that his Company held 1,635 machines leased from the United Company; that the cost of installing them under restricted leases was between $10,000 and $12,000; and that the cost under unrestricted leases would be over $250,000, a difference of approximately $240,000 (R. Vol. 1, p. 180, lines 38–45; p. 183, lines 37–38).

But this evidence utterly fails of its purpose. The International Shoe Manufacturing Company is one of the largest shoe manufacturers in the world, having $25,000,000 capital, making 50,000 pairs of shoes a day and operating 20 different factories (R. Vol. 1, p. 184). $240,000 (an average of $12,000 for each of its factories) is on its face not a prohibitive sum to pay for the right to take the United Company's machines adapted for use as a series and to use them independently for a period of seventeen years. Certainly it is not a prohibitive sum for a $25,000,000 corporation to pay.

Furthermore, this sum of $240,000 includes the purchase price of all General Department machines used by the International Company in its twenty factories. When purchased they would be owned by the company outright and the company would thus avoid the annual rental which would otherwise be payable on them.

Furthermore, counsel for the United States argues as though the International Company would be required to pay this sum of $240,000 if it wished to use the United Company's machines in part and competitors' machines in part. But under no circumstances would this be true. In the first place, as we show below, the machines of the United Company to use with which others are restricted are comparatively limited in number, so that the International Company could take and use a very large number of the machines it requires in its factories from competitors without having to change a single restricted lease held by it to an unrestricted lease. In the second place, a very considerable portion of this sum consists of initial payments for Goodyear machines. As they are not restricted under any form of lease to use with machines of other departments, it would not be necessary to take them on initial payment leases in order to use them with machines of others. In the third place, if the International Company desired to use a competitor's machines, for example, a competitor's heeling and metallic machines, it would, of course, not take these machines from the United Company. It would, therefore, not pay the United Company any initial premiums for such machines. The sum of $240,000 includes initial payments on machines of all kinds furnished by the United Company. To find what the International Company would pay if it took all machines

except heeling and metallic machines from the United Company on unrestricted leases, it would be necessary to deduct from the sum of $240,000 the initial payments on the metallic and heeling machines and also, as we have stated, the initial payments on the Goodyear machines. The amount left would be a comparatively small part of $240,000.

As to the contention that the initial payments charged are prohibitive or unreasonable, the District Court found as follows (R. Vol. 1, p. 1166):—

> "But surely, if the argument is made that there is coercion through an excessive price, such an argument can have no weight whatever for any purpose legal or ethical unless the fact that it is excessive affirmatively appears. From such evidence as is presented in this case as to the amount of initial charges upon independent leases we can draw no support for the charge of coercion through excessive charges."

(6) Contention that the Restricted Use Clauses were Adopted for the Purpose of Excluding the Use of Competitors' Machines.

As the Restricted Use Clauses do not compel a shoe manufacturer desiring to take one type of machine to take other types, since he is free to take the type he desires on an unrestricted lease for a reasonable payment, our next inquiry is whether the Restricted Use Clauses were adopted with intent to exclude competitors and are unlawful for this reason.

We have shown that a reduced or wholesale price is fair and reasonable when a series of machines is used. We have also shown that the United Company could only offer such

a wholesale price by agreeing with the lessee that a machine taken for use as part of a series should be so used, that is, by employing the Restricted Use Clause or some clause having the same effect.

The Restricted Use Clause must be held to have been introduced for this legitimate business purpose unless there is affirmative evidence to show that the United Company introduced the clause, not for this purpose, but for the purpose of arbitrarily compelling the use of its machines and the exclusion of competitors' machines. Not only is there no evidence of such purpose, but the contrary is affirmatively shown by—

1. The testimony of the officials of the United Company as to the purpose for which the Restricted Use Clause was adopted;

2. The findings of the District Court made after hearing the testimony of the witnesses and after an exhaustive study of the leases and their effect;

3. The fact that the United Company always offered alternative unrestricted leases;

4. The history of the adoption of the Restricted Use Clauses;

5. The limited effect of the Restricted Use Clauses.

(a) Testimony as to the Purpose of the Restricted Use Clauses.

Mr. Winslow testified that the purpose of the Restricted Use Clause was to enable the United Company to eliminate the initial payments and thus reduce its charges and at the same time secure a fair return.

"The restricted-use clause was adopted in our leases for the purpose of giving the company a proper return for the use of the machines when they were leased without initial premiums, and for that reason alone. With the terms of royalty fixed the company would not, without the initial premiums, receive a fair return for the machines unless they were used together as restricted in the leases. As a business proposition, after the initial premiums were removed, there would be no security whatever for a proper and fair return for the use of the machines without the restricted-use clause" (R. Vol. 1, p. 452, lines 29–38).

. . . . . .

For his testimony as to the reasons why such fair return could be secured where the initial payments were eliminated by requiring the machines to be used as a series, see Main Brief, pp. 342–3.

(b) Findings of the District Court as to the Purpose of the Defendants in adopting Restricted Use Clauses.

The District Court held that the Restricted Use Clauses were not adopted with any unlawful purpose. Among other things it said (R. Vol. 1, p. 1184):—

"The grouping of the machines in order that some may aid others in turning out a product affords a sufficient mechanical reason for installing them as groups and a sufficient business reason for dealing with them as groups.

"That there are sound mechanical and business reasons for grouping together machinery as it is grouped by a series of prohibitive leases is abundantly established. The United States fails to show that the grouping of machines is in fact made merely as an unlawful artifice and not because of sound mechanical and business reasons."

Referring to the Restricted Use Clause and other modifications made by the United Company in the leases, the District Court further held (R. Vol. 1, p. 1159):—

> "Modifications in the contracts offered them tending, as these are shown to have done, to enable the company, through provisions adapted to increase the number of shoes worked on by each machine, to lessen the royalty charged per pair, and to diminish or dispense with the initial payment before required, were so obviously prompted by the purpose of developing the company's business through the perfectly legitimate method of offering them on terms more advantageous to users, that it would be unjust to treat them, on evidence no stronger than that here presented, as really intended to accomplish an arbitrary exclusion of users from any dealings with others."

(c) History of the Adoption of the Restricted Use Clause.

From the contentions of the United States and the allegations of the petition one would expect to find that the defendants immediately, upon the formation of the United Company, arbitrarily inserted the Restricted Use Clauses in the various leases.

An examination of the record shows that the Restricted Use Clause was not inserted in any lease for over a year after the United Company was formed, and that it was then introduced only from time to time in leases of different types of machines as the United Company found it possible to reduce its charges for such machines when they were used as part of a series. The following summary will show that in practically every case where the clause was adopted it was accompanied by such a reduction in charges:

Goodyear Machines. The United Company has never restricted the use of its Goodyear machines to use with machines of any other department, although they are in many respects its most important machines.

Metallic Machines. The Restricted Use Clause was not employed in leases of metallic machines until June, 1900.

The royalty for metallic machines is obtained entirely from the sale to the lessee of wire and nails adapted for use in the machines. Such wire and nails are composed largely of copper. Copper had increased in price from 11 cents and less in 1899 and prior thereto, to 16½ cents in 1900. The United Company, however, had not raised the price charged lessees for this material, the result being that it was selling lessees material at cost or less, and, therefore, receiving no royalty for its machines. It was entitled to increase the price charged for material, but did not wish to do so. It determined that it could afford to continue selling material at the existing prices to lessees, who also used its welter and stitcher, and lasting machines. The total royalty obtained from the three sets of machines would afford it a fair return. It, therefore, inserted in its leases of metallic machines thereafter put out a clause restricting their use to use with its welter and stitcher, and lasting machines, and continued to furnish materials at the same price as previously. To lessees desiring to use its metallic machines with lasting or welting machines obtained from others it offered a lease in which 10 per cent. more was charged for material than under the restricted lease. Later it adopted a lease without restrictions in which an initial payment was charged and the price of materials was the same as under the restricted lease. The lessee has, therefore, been offered

three alternative forms of lease, two of which contain no restrictions. No other restrictions have ever been introduced into the metallic leases. For a discussion of the introduction of the Restricted Use Clause into the metallic leases, see Main Brief, pp. 275–276, 290.

Heeling Machines. No Restricted Use Clause was employed in leases of heeling machines until 1904, over five years after the formation of the United Company. The Goodyear Company had charged substantial initial payments for its welting and stitching machines, and these charges had been continued by the United Company. The amount of these charges made it difficult for shoe manufacturers of small capital to make Goodyear shoes. This placed the small shoe manufacturer at a disadvantage. In order to remove this disadvantage and to encourage the further use of Goodyear machines, the United Company, in the fall of 1904, decided to eliminate these initial payments. As pa· ial compensation for the elimination of these payments, it introduced into its heeling machine leases a Restricted Use Clause restricting the heeling machines to use with its lasting and metallic machines and (if used upon welt or turn shoes) to use with its welter and stitcher, and (if used upon pegged shoes) to use with its pegger. When the manufacturer used a series of these machines, each machine produced more work, and the cost of caring for each machine was reduced. To shoe manufacturers who did not use its other machines of these classes the United Company offered an unrestricted lease of heeling machines under which an initial payment was charged. For a discussion of the introduction of the Restricted Use Clause in heeling machine leases, see Main Brief, pp. 277–278; 289–290.

Lasting Machine Leases. No change in the leases of lasting machines was made for over a year after the formation of the United Company.

The Ideal Lasting Machine, previously manufactured by the Goodyear Company, had always been restricted to use with the Goodyear welter and stitcher. No new restriction was ever introduced into the leases of this machine. The machine itself has become practically obsolete (see Main Brief, p. 286).

The lease of the McKay & Copeland machine was not changed until August, 1903, four and one-half years after the formation of the United Company. A new form was then put out reducing the initial payment previously charged, and restricting the use to use with the United Company's welter, stitcher, pegging, metallic, and heeling machines. The old form of unrestricted lease could be obtained by any lessee who desired it (see Main Brief, p. 287). This machine is now practically obsolete (R. Vol. 1, p. 454, lines 8–9).

No change was made in the leases of the Chase machine until 1901. A new form was then adopted restricting its use to use with the United Company's welting and metallic machines. It eliminated the Additional Machinery Clause which required an exclusive use of the machine. An unrestricted lease requiring an initial payment was offered as an alternative. This machine is now practically obsolete (see Main Brief, p. 287).

No change was made in the lease of the Consolidated Hand Method McKay machine until the end of 1900. The United Company then adopted two forms of lease, one requiring an initial payment and containing no Restricted Use Clause, and the other requiring no initial payment and

restricting the machine to use with the Goodyear welter and stitcher and metallic machines. The Additional Machinery Clause was eliminated from the new lease. The restriction to the Goodyear welter and stitcher was of no effect, as the machine was adapted for use only on McKay work on which Goodyear machines are not used (see Main Brief, p. 288).

No change was made until December, 1900, in the lease of the hand method welt laster, which was purely an experimental machine, in 1899. At this time, when the machine was made commercial, two forms of lease were adopted. Under one form the royalty was reduced from one cent to five-eighths of a cent per pair and the machine was restricted to use with the welter and stitcher. Under the other form the machine was unrestricted, the same reduced royalty of five-eighths of a cent was charged, and an initial payment of $300 (see Main Brief, p. 289).

(d) Use of Restricted Use Clause in Leases of New Types of Machines.

As new types of machines were gradually invented they were generally offered on restricted or unrestricted leases at the option of the shoe manufacturer.

Thus two forms of leases were adopted for eyeletting machines, which were first put out in 1902. Under the restricted lease no initial payment was charged and the machine was restricted to use with certain other machines. Under the unrestricted form an initial payment of $100 was charged (see Main Brief, p. 294).

Similarly two forms of lease were adopted for other new

machines which were invented or developed by the United Company, one form being an unrestricted initial payment lease and the other a restricted non-initial payment lease, except that in the case of General Department machines, including the McKay sewing machines, instead of offering an unrestricted lease as an alternative, the United Company sold the machines outright at the option of the shoe manufacturer, and except that no restricted lease was ever offered of clicking machines (see Main Brief, p. 294).

The gradual introduction of the Restricted Use Clause into the leases over a long period of years, and the fact that it was not employed at all for over a year after the United Company was formed, shows conclusively that it was not one of the purposes in the formation of the United Company to use this clause generally in the leases or impose it generally upon lessees. The fact that in practically every case it was accompanied by a reduction in charge shows that its purpose was to enable the United Company to make such reduction.

(e) The Fact that Alternative Unrestricted Leases were Offered Lessees Shows that the Restricted Use Clause was not Employed to Compel the Use of the United Company's Machines.

As we have stated above, the United Company continued to offer its lessees unrestricted leases on terms as favorable and in some cases more favorable than were offered by the constituent companies.

It is inconceivable that if the defendants had planned

to form the United Company and then introduce Restricted Clauses in the leases which would compel a lessee taking machines of one type also to take machines of other types that it would have continued to offer machines without such restrictions on more favorable terms than were previously offered.

(f) The Limited Effect of the Restricted Use Clauses.

The comparatively limited effect of the Restricted Use Clauses will show how unadapted they are to exclude the use of competitors' machines. Far from prohibiting a shoe manufacturer who holds a machine under a restricted lease from using such machine unless he also takes and uses all other types furnished by the United Company, the Restricted Use Clause restricts such machine to use in some cases with only one and in others only two or three other kinds of machines and permits the shoe manufacturer to use it in connection with the great majority of machines in his factory whether obtained from a competitor or not.

The restrictions imposed when the restricted forms of lease are taken are as follows (see Main Brief, p. 371):—

The Goodyear Department machines, although in many respects the most important machines the United Company makes, have never been restricted to use with the machines of any other department.

Metallic machines are restricted to use only with the welter and stitcher, and lasting machines.

Heeling machines are restricted to use only with the welter and stitcher, lasting, pegging, and metallic machines.

Lasting machines now in practical use are restricted as follows:—

The Hand Method Welt Machine to the welter and stitcher.

The Hand Method McKay Machine to metallic machines.

The No. 5 to the welter and stitcher, pulling-over, and metallic machines.

The McKay Sewing Machine when leased and not sold outright is restricted to use only with the lasting machine.

General Department machines when leased and not sold outright are restricted to use only with the welter and stitcher, lasting, pegging, and metallic machines.

Eyeletting machines are restricted to use with the welter and stitcher, lasting, pegging, metallic, and heeling machines.

Pulling-over machines are restricted to use with the welter and stitcher, lasting, metallic, pegging, and heeling machines.

The clicking machine is not restricted to use with any other machines, but a smaller royalty is charged when used with the United Company's welter and stitcher, and lasting machine.

In practice the restrictions are actually less than would appear from reading the above statement. A manufacturer of McKay shoes does not use the welter and stitcher, and therefore he is not affected by a restriction to those machines; a manufacturer of turn shoes does not use a stitcher and usually does not use lasting machines; and only a very few manufacturers make pegged shoes and are affected by the restriction to the pegger.

It will be seen that the machines which are restricted are restricted to use with a comparatively limited number of principal bottoming machines. With two slight exceptions the machines to use with which others are restricted are only the welter and stitcher, lasting and metallic, and,

in some few instances, heeling machines. The two exceptions are that the No. 5 Lasting Machine, a new machine, first put out in 1908, is restricted to use with the pulling-over machine, and a few machines are restricted to use with the pegging machine. As the hand method lasting machines will do the kind of work done by the No. 5, and as very few pegged shoes are made, these exceptions have no real significance.

As the manufacturer of McKay shoes and the manufacturer of nailed shoes, which together constitute about half the shoes made (R. Vol. 1, p. 424), do not use either the welter or stitcher, they are concerned only with the restrictions which relate to lasting, metallic and heeling machines.

No machines of any kind are restricted to use with the Goodyear auxiliary machines (of which the United Company manufacturers 43 different kinds), General Department machines (of which the United Company manufactures over 170 different kinds), McKay sewing machines, pulling-over machines (with the single slight exception noted above), eyeletting machines, clicking machines, lacing machines, treeing machines, insole machines, buttonhole machines, and various other miscellaneous machines which the United Company manufactures. Of course none are restricted to use with machines for sewing uppers and other machines which the United Company does not manufacture. The result is that a shoe manufacturer can obtain any machine he desires from the United Company even on the restricted form of lease and use it with any one or all of the many machines enumerated above obtained from competitors.

As no machines are restricted to use with the above-

mentioned types of machines, it is obvious that the Restricted Use Clauses do not compel lessees to take them, or any of them.

Furthermore, the remaining types of machines, namely, the Goodyear Department, lasting, metallic, and heeling machines are not all restricted to use together. The Goodyear machines are not on any form of lease restricted to use with either the lasting, metallic or heeling machines. Neither the lasting nor the metallic machines are on any form of lease restricted to use with the heeling. The Goodyear welter and stitcher, the lasting, metallic and heeling machines are not on any form of lease restricted to use with the Goodyear auxiliaries, nor are any of these auxiliaries restricted to use together.

There are, therefore, various combinations in which a shoe manufacturer can obtain from the United Company on restricted leases such of these machines as he desires to take from it, and obtain from competitors for use with them such other machines of these types as he needs. For example, a shoe manufacturer making welt shoes may in the following combinations use the United Company's machines with a competitor's machines of the type named, although the United Company's machines are held on non-initial-payment or restricted leases.

No. 1. The United Company's Goodyear Welter and Stitcher.
Competitor's Welt Auxiliary Machines (in whole or in part).
Competitor's Lasting Machines.
Competitor's Metallic Machines.
Competitor's Heeling Machines.

No. 2. United Company's Goodyear Welter and Stitcher.
United Company's Goodyear Welt Auxiliary Machines (in whole or in part).
Competitor's Lasting Machines.
Competitor's Metallic Machines.
Competitor's Heeling Machines.

No. 3. United Company's Goodyear Welter and Stitcher.
United Company's Goodyear Welt Auxiliary Machines.
United Company's Hand Method Welt Lasting Machine.
Competitor's Metallic Machines.
Competitor's Heeling Machines.

No. 4. United Company's Welter and Stitcher.
Competitor's Welt Auxiliary Machines.
United Company's Metallic Machines.
United Company's Hand Method Welt Lasting Machine.
Competitor's Heeling Machines.

In any of the above combinations the lessee is free to use competitors' machines of all the kinds not enumerated. For other combinations, see Main Brief, pp. 373–374.

The result is that a lessee who does not want to make initial payments to the United Company and who takes restricted leases of such machines as he desires from the United Company is still able to use his machines so taken with the great majority of machines in his factory, whether such other machines are obtained from competitors or not.

Had the United Company intended by the Restricted Use

Clauses to compel a shoe manufacturer taking machines from it to use its machines exclusively, or practically exclusively, and thus exclude a competitor's machines, it would surely not have so drawn the Restricted Use Clauses that they permit the lessee who takes machines under them to use them in connection with the great majority of machines in his factory, even though obtained from competitors.

I. Legality of the Restricted Use Clause.

The Restricted Use Clause is:—

1. A normal provision designed to accomplish a legitimate business purpose beneficial alike to the lessor and the lessee.
2. It does not in any way restrain trade.
3. It is a valid patent restriction which the United Company is entitled to impose.

(1) The Restricted Use Clause is a Normal Provision Designed to Accomplish a Legitimate Business Purpose.

The Restricted Use Clause, being a normal provision designed to accomplish a legitimate business purpose, is lawful even if no patents or patent rights were involved. We shall, therefore, first consider it without reference to the patent situation.

We have shown above that the Restricted Use Clause was adopted to enable the United Company to offer to a shoe manufacturer desiring to use a series of its machines a reduced or wholesale rate, and that it is the only practicable way in which such a right can be offered under the leasing system.

That the United Company is entitled to share with its lessees the economies which result where a series of its machines are used seems too obvious for argument. Such a transaction benefits both the United Company, by enabling it to offer its machines on better terms, and the shoe manufacturer, by giving him lower rates for his machines. It is a normal legitimate business transaction.

If this be so, surely the United Company can provide for such reduced rate in the only practicable way, namely, by agreeing with the shoe manufacturer that machines taken for use as a series shall be so used.

Counsel for the United States, as we understand them, do not deny that economies result from the use of a series of machines. Their contention, as we understand it, is:—

(1) That the Restricted Use Clause was adopted with unlawful intent and for this reason is unlawful;

(2) That even if not adopted with unlawful intent it is inherently unlawful because of its effect on competitors.

We have reviewed above certain of the evidence which fully sustains the District Court's finding that the clause was not adopted with unlawful intent, but for the purpose of enabling the United Company to offer a reduced or wholesale rate.

We shall, therefore, now discuss briefly the contention that the clause is inherently unlawful because of its effect on competitors. For a more complete discussion of the subject, see our Main Brief, pp. 383–393.

Let us first inquire just what effect this clause has upon competitors. It is obvious that it does not affect at all a competitor who offers a complete series of machines. A shoe manufacturer just entering business is free to choose between the United Company's series and such competitor's

series. A shoe manufacturer who already holds the United Company's machines is free, so far as this Restricted Use Clause is concerned, to cease using the United Company's machines and to take and use the competitor's series of machines.

The sole objection of the United States, therefore, must be that if a shoe manufacturer desires to use one or two of the series of machines furnished by the United Company he may by reason of the better terms offered when the entire series is used be induced to use such series and not interject into the series one or more machines obtained from the competitor. The result, it contends, is that a competitor offering a single machine or less than an entire series is at a disadvantage.

The United Company's machines are adapted for use together and for all practical purposes constitute a single article. Except that they do not have a physical connection they constitute a single article just as much as do the component parts of a parlor car or a locomotive. The boiler of a locomotive has a less intimate relation to the wheels than has the lasting machine, which prepares the work for the welter, to such welter. A device for holding or folding paper forming part of a printing press has less connection with the rollers which perform the actual operation of printing. There is no more reason why the United Company should be required to permit the use of its lasting machine and welter separately than there is why it should permit the use of the different parts of its welter separately.

When analyzed, the contention of counsel for the United States merely amounts to this,—that a manufacturer who furnishes a complete article has an advantage over the

manufacturer who offers only one of the component parts of the article, and, therefore, that the manufacturer of the complete article either cannot offer it for sale as a complete article at all, or must, if he offers it for sale or use, also offer each component part separately on terms which will enable others to obtain certain parts from him and the remaining parts from his competitors and thus get the complete article as cheaply as if it were obtained as a whole from him. We submit that to state this contention is to refute it.

Take an illustration on all fours with the present case. The Pullman Company leases its parlor cars to railroads. It obviously has an advantage over a competitor who only manufactures car wheels. Such competitor offering his wheels to the railroad is met by the statement that the Pullman Company either refuses to lease its wheels and bodies separately or that, if it does, it charges retail prices which total more than the price charged for the complete article. The contention of the United States, as we understand it, is, first, that the Pullman Company must lease the parts of its car separately so that the manufacturer of wheels shall not be at a disadvantage; and, second, that it must lease the separate parts at such prices that the total for all the parts will not exceed the prices charged for the complete car, or will be so little in excess that the manufacturer of wheels alone will not be at a disadvantage.

But on what possible theory can the Pullman Company be required to lease the parts of its car separately, or, if so, on what possible theory can it be forbidden to charge a wholesale price for the complete car?

It is no offence against morals or law for a manufacturer of a complete article to refuse to sell or lease the parts separately. The Pullman Company would be fully justi-

fied in leasing its car only as a whole, and the United Company would be fully justified in furnishing the use of its machines only as a series and refusing to offer any use of individual machines separately.

The District Court said:—

> (R. Vol. 1, p. 1184.) "The grouping of machines in order that some may aid others in turning out a product affords a sufficient mechanical reason for installing them as groups and a sufficient business reason for dealing with them as groups."

But if we assume that the United Company is required by law to permit the use of its different types of machines separately, surely it is not prohibited from charging more when a machine is taken for use separately than is charged when it is taken for use as a part of a series.

Such a reduced charge is merely a wholesale price. It is customary in practically every business in the country. In the usual sale at wholesale, for example in the sale of six machines of the same kind, the actual saving if any effected is usually small. In the case of the use of a series of six different machines which are adapted for use together, which are cared for by the lessor, and are paid for according to the number of shoes they produce, there is no question but that a large saving is effected which justifies the reduced price. That the United Company can grant the use of a series for a reduction equal in its judgment to the increased return effected by such use, or any part of such increased return, we submit is beyond question.

One further fact must be borne in mind. The machines leased belong to the United Company. It does not sell them or part with title. In its leases it is not attempting,

therefore, to provide how machines which it has sold and disposed of shall be used in the future; it is merely regulating the use of its own property. It has a right to refuse to permit any person to use machines which it owns. In consenting that such machines be used it does not part with the right to direct how they shall be used. And in providing that its own machines which are adapted for use together and when so used produce the best results shall be used together, it is clearly not overstepping its rights as owner of the machines.

We submit that the Restricted Use Clauses constitute merely a control by the United Company of the use of its own machines which is clearly justified. We further submit that these clauses are reasonable normal agreements providing merely for a wholesale price and are clearly not condemned by the Sherman Act.

For a more complete discussion of this question, see Main Brief, pp. 380–396.

(2) The Restricted Use Clauses do not Restrain Trade.

The Restricted Use Clauses are clearly not within the Sherman Act if they do not restrain trade, but, on the contrary, relax an existing restraint. Such is their actual effect.

The United Company's machines are its property. No shoe manufacturer, therefore, has a right to use them without the United Company's consent. An absolute legal restraint exists prohibiting their use by shoe manufacturers, except so far as the United Company consents to relax this restraint.

In agreeing under the terms of the Restricted Use Clauses that the shoe manufacturer may use them as a series, but not separately, the United Company grants the shoe manufacturer a right he did not have previously, namely, the right to use these machines as a series. The shoe manufacturer's liberty of action is not restrained in any respect whatsoever. The Restricted Use Clause does not require or obligate a lessee to use the United Company's machines. It merely permits him to use them if he so desires. Prior to accepting a lease of the United Company's machines he could use any other machines obtained from competitors, but he could not use the United Company's machines at all. After accepting restricted leases of a series of the United Company's machines he can still, so far as the Restricted Use Clauses are concerned, use any other machines obtained from competitors he pleases and he also has acquired the right to use the United Company's machines as a series.

In other words, his liberty of action has not been in the slightest degree restrained and he has acquired an additional right, namely, the right to use a series of machines, which right he did not have previously.

A provision which in no way restrains the freedom of the lessee and which grants him an additional right can hardly be termed a restraint of trade.

It is true that if the shoe manufacturer were granted the right not only to use the machines as a series, but also the right to use any one or more of them as he chose, he would obtain still greater rights. But this does not refute the fact that the grant of the right to use as a series is the grant of an additional right which the shoe manufacturer did not have before and that it imposes no new restraint (see Main Brief, pp. 396–399).

(3) The Restricted Use Clause is the Grant of a Valid Patent License and is therefore Lawful.

The agreements under which the United Company's machines are leased constitute agreements whereby the machines themselves are loaned to the lessee and they also constitute licenses under the patents embodied in the machines granting the lessee a right to use such patented inventions so embodied in the machines to the extent set forth in the license. The Restricted Use Clause provides that the leased machines shall be used only as part of a series. It is a grant of a limited instead of a complete and unrestricted right of use.

A patentee is granted the right to exclude all others from making, using, or vending his patented machine without his permission. It has never been questioned that he can refuse such permission or that he can at his discretion grant a complete or partial permission to exercise these rights. The patentee's motive in refusing to grant any rights, or in granting only partial rights instead of full and complete rights of use or sale, cannot be questioned.

As the patentee has a complete monopoly, any license to use or sell a patented article which he grants whether partial or complete is a relaxation of a lawful restraint imposed by law on its use or sale, and such grant cannot, therefore, restrain trade or create any additional monopoly in the patented article.

In granting a partial license to use or sell, the patentee reserves all rights not granted. If the licensee oversteps the rights granted him he becomes an infringer.

We do not understand that the foregoing principles have ever been questioned by this Court.

In the present case, the United Company in granting a lease containing a Restricted Use Clause merely grants a partial license to use. It permits the licensee to use the leased machine as part of a series comprised of other patented machines owned by it. It does not grant the right to use the machine otherwise. The licensee, therefore, cannot use the leased machine except in a series without overstepping the limits of his grant and becoming an infringer.

We have shown above that the purpose of the United Company in granting a partial right of use is solely to enable it to offer a reduced rate for a series of machines. But even if its purpose were otherwise, it would be immaterial, since the United Company as patentee is entitled to grant either partial or complete licenses or no licenses at all, regardless of its motives.

Any person using a patented article commits infringement and can be enjoined unless the patentee has lost the right to control such use of the patented article. A patentee loses the right to control such use only (1) where he sells the patented article without reservation and thus places it outside the limits of the patent monopoly, or (2) where he grants a license to use it in the manner in which such second party is using it.

In the present case the United Company has not sold its patented machines and, therefore, has not placed them outside the limits of its patent monopoly, nor has it granted a license to use them except as a series. Any use of the machines except as a series, therefore, constitutes an infringement of its patents.

The United Company in installing its machines in a factory does not sell them. It retains full title and at the

termination of the lease, whether by expiration of the term or due to a prior cancellation, the lessee has no further rights or interest in them. The machines, therefore, are not sold and paid for; they do not pass outside the limits of the patent monopoly, but remain subject to the protection of the patent and the control of the United Company and can only be used as the United Company expressly permits. The only permission to use held by the lessee is contained in the lease and license agreement under which the machines are installed.

By such lease and license agreement the lessee is granted the right to use the leased machines only in certain defined ways. He can use them only at a certain factory, he must use them himself and he can use them only as part of a series of the United Company's patented machines. Any use contrary to these provisions he is not authorized to make, and, therefore, such use constitutes an infringement of the United Company's patents.

Counsel for the United States, however, assert that such a restricted license is not a proper patent license, and to sustain their contentions cite certain recent cases of this Court. We respectfully submit that these cases in no way sustain their contention or contravene the principles of law laid down above or their application to the present case.

In *Motion Picture Patents Co.* v. *Universal Film Co.*, 243 U. S. 502, the patentee granted a license to make and sell a patented machine for exhibiting moving-picture films. The licensee was, however, required to sell such machines under the restriction and condition that the machines should be used solely for exhibiting pictures containing the inventions of a certain patent for films. The patent on the films had

expired. The defendant leased a machine which had been sold to its lessor bearing a notice setting forth the above restrictions, and the defendant used this machine with films furnished by a third person of a kind not permitted by the attempted restriction. Suit for infringement of the patent on the machine was brought.

The question was, as stated by the Court:—

> "May a patentee or his assignee license another to manufacture and sell a patented machine and by mere notice attached to it limit its use by the purchaser or by the purchaser's lessee, to films which are no part of the patented machine, and which are not patented?"

The case is clearly distinguishable from the present case on three grounds:—

1. In the Motion Picture Patents case the patented machine had been sold and paid for and thus placed outside the limits of the patent monopoly. The patentee was attempting to restrict an article which had passed beyond his control.

In the present case, as we have pointed out, the machines have not been sold or paid for. They remain the undisputed property of the United Company and cannot be sold or used except to the extent that it permits.

2. In the Motion Picture Patents case the restriction was held to be a restriction on the use of films and not on the use of the patented machine at all. Since the restriction, therefore, was held not to restrict the use of the patented machine, it was, of course, not a patent restriction. No question of the effect of the granting of a limited or partial right of use was involved. At the most the restriction was an attempt by mere notice or agreement to restrict

the use of a machine which had been sold and had passed beyond the control of the patentee.

That the restriction was on the films and not on the machine was shown by the facts of the transaction. The patentee had sold the patented machine and had no interest in its future use. The purpose of the restriction was, therefore, clearly to obtain control of unpatented films used in the machine. The patentee, having charged such price as he saw fit for the machine and the right to use it, attempted in addition to control the use of the films, which had no relation to the use of the machine. This Court, therefore, held:—

> "Both in form and in substance the notice attempts a restriction upon the use of the supplies only and it cannot with any regard to propriety in the use of language be termed a restriction upon the use of the machine itself."

In the present case the restriction is clearly on the use of the patented machine. The United Company's machine is designed and adapted for use in connection with other patented machines which no one else furnishes. When so used it produces more work and better work. The United Company is vitally interested in having the machine which it owns used most effectively and in the manner for which it is designed. The reputation of its machine is thus enhanced and the royalty payable to the United Company increased. In providing that its machine shall be used in the manner for which it is designed to be used, and in which it can be used most effectively, the United Company is obviously controlling the use of the machine itself and not of any other machine or article. In form as well as in substance the restriction is on the use of the patented machine.

3. In the Motion Picture Patents case the patentee attempted to control the use of unpatented films and thus to acquire a monopoly of such unpatented films which had no relation to its patent.

In the present case the restriction relates entirely to the United Company's patented machines. The United Company is not attempting directly or indirectly to control or to require the lessee to take or use unpatented machines or materials.

The facts in the Motion Picture Patents case and the decision in that case have, therefore, no bearing upon the present case. Nor does that case in any way affect the well-recognized rule that a patentee may grant a complete or partial license to use, and that, in case of a partial license to use, any use not so licensed constitutes an infringement.

In *Strauss* v. *Victor Talking Machine Co.*, 243 U. S. 490, the Victor Company attached a notice to each machine providing that its use for demonstration purposes only was granted dealers and retailers; that they could sell the machine to the public with a right to use it only upon payment to them of a royalty of $200; and that title remained in the Victor Company until the expiration of the patents embodied in the machine. The Victor Company received the full payment to which it was entitled upon delivering the machines to the wholesaler and received no part of the $200 for which the machines were to be sold to the public. The defendant, a retailer, obtained machines from retailers or wholesalers for less than $200, the price which was to be paid when sold to the public, and was selling these machines for less than $200. The Victor Company prayed that the defendant be enjoined from

selling the machines and from violating the Victor Company's patent rights.

The Court held that the evident purpose and intent of this transaction was not to control any use of the machines, but that it was a mere attempt to restrict the prices charged for them after the plaintiff had been fully paid for the machines and they had passed into the possession of dealers and the public, in other words, after they had passed outside the limits of the patentee's control, and that the case, therefore, fell within the rule of *Bauer* v. *O'Donnell*, 229 U. S. 1.

It is obvious that in the present case the United Company has not disposed of its machines and received full payment for them and they have therefore not passed beyond the limits of its patent monopoly.

In *Bauer* v. *O'Donnell*, 229 U. S. 1, the plaintiff sold Sanatogen, a patented remedy in packages bearing a notice that they were licensed for sale and use by retailers at a price not less than one dollar. The defendant, a retailer, had bought packages from jobbers which he sold for less than the price named. He was sued for infringement.

The majority of the Court held that the patentee by selling the packages with full right of use had "exercised" his exclusive right to sell granted him by the patent law and had placed the packages outside the "limits of the monopoly granted by the patent law." The attempted restriction on future sales was, therefore, not a restriction of any patent right, or the grant of a limited patent right, since all rights which the patentee had in respect to these particular packages had been sold and transferred by him. No future sales of these packages could, therefore, constitute an infringement. No question of a patent restriction was, therefore, involved in the case.

In *Henry* v. *Dick*, 224 U. S. 1, accepting the minority opinion as the opinion of the Court, since the decision of the majority was overruled in the Motion Picture Patents case, we again find that the decision has no bearing upon the present case.

In that case a patented mimeograph was sold and paid for, and a notice was attached to the machine stating that it could be used only with paper, ink, and other supplies furnished by the Dick Company. Suit was brought against the defendant Henry for contributory infringement in selling ink to one Miss Skou to be used on a machine which she had so bought and owned.

A majority of the Court held that, in spite of the sale of the machine to Miss Skou, the patent right granted Miss Skou was a limited one, namely, the right to use the machine with supplies furnished by the Dick Company, and that the use of the machine with other supplies constituted an infringement. Henry was, therefore, held to be a contributory infringer.

The minority did not dispute the rule of law applied by the majority, namely, that if a limited license were granted, any use not so permitted constituted infringement, but did dispute its application to the facts of that case. It held that the restriction in question was not a reservation of a right to use the machine, but was a restriction upon the use of the materials employed in using the machine. It held that under the sale to Miss Skou every possible patent right in the machine was transferred to her. Thus the minority said (p. 65):—

> "That the sale here in question was one of all the rights which the patent protected has, it seems to me, at the outset been demonstrated beyond reasonable dispute."

As the machine had, therefore, been sold with full rights of use, it had, of course, passed beyond the limits of the patent monopoly, and the restriction was necessarily not a reservation of patent rights in the machine, since these had all been sold, but a mere attempt by notice to restrict the use of certain unpatented materials in the machine.

The case is clearly inapplicable to the present case. In the present case the machine has not been sold, but it is still owned by the United Company, and only a limited right of use has been granted, namely, the right to use in a certain factory by the lessee himself and as part of a series of machines.

We submit that in the present case we have a clear case of (1) a control by the United Company of machines still owned by it and within the limits of its patent monopoly, and (2) a limited patent license granting a right to use the machines as part of a series and prohibiting or refusing any other use.

The United Company is entirely within its rights as patent owner in granting such a limited right of use and in declining to grant full rights of use.

For a full discussion of this subject and of the cases relating to patent restrictions, see our Main Brief, pp. 399-419.

J. Auxiliary Restricted Use Clause.

By the Auxiliary Restricted Use Clause the use of auxiliary machines, which aid or assist the work of the principal machines of a department, are restricted to use with such principal machines.

Nearly all of such auxiliary machines are in the Goodyear Department. The Goodyear Company restricted them to use with its principal machines, the welter and stitcher, and the United Company has merely continued this same practice.

The principal machines are not restricted to use with the auxiliary machines. A lessee who takes a welter and stitcher can use them with auxiliaries obtained from competitors if he so desires, or can use them with auxiliaries obtained partly from competitors and partly from the United Company.

There were various reasons why this method of furnishing auxiliary machines was adopted and why it has been continued.

1. The welter and stitcher were first invented. Afterwards the Goodyear Company, and later the United Company, invented from time to time auxiliary machines, to assist the work of the welter and stitcher, by preparing the work for those machines or by completing the work after leaving those machines. The company wished to furnish these machines without additional royalty in order to encourage and increase the use of its welter and stitcher on which it was receiving a royalty. It, therefore, loaned them to the lessee without charging any additional royalty, receiving only a comparatively small initial payment, or, after 1904, a rental, and obtaining its compensation through the increased use and productivity of the welter and stitcher. But of course it could not afford to give the lessee these expensive machines without royalty unless they were used with its welter and stitcher, for which a royalty was paid. It, therefore, restricted them to use with the welter and stitcher.

2. The principal machines, the welter and stitcher, have recording mechanisms which record more or less accurately the amount they are used and thus enable the United Company to determine the royalty due. Such mechanisms cannot be placed on most of the auxiliary machines. By restricting the use of these machines to use with the welter and stitcher, the United Company is relieved of the almost impossible task of checking the separate use of all of these numerous auxiliary machines.

3. The United Company does not like to lease a machine unless it can keep it in efficient and satisfactory condition. If it leased each auxiliary machine separately for a separate rental or royalty which seemed reasonable, it could not afford for such royalty to care for these separate machines. When one or a number of auxiliary machines are taken for use with the welter and stitcher as a unit, the expense of caring for them is, of course, less per machine.

4. It would be almost impossible to divide the comparatively small Goodyear royalty fairly among the 45 machines of the Goodyear Department. The royalty for many of the machines would be trivial and the expense of determining the amount of use of each of such machines would amount to more than the royalty. They are, therefore, leased as a unit.

5. If a separate royalty were placed on each auxiliary machine, when a new auxiliary machine was invented and a royalty charged for it, the total royalty for the Goodyear set would be increased, or the royalties on each of the machines of the Department would have to be revised. By leasing the machines as a single series this difficulty is avoided.

6. If a royalty were charged for each auxiliary machine, many shoe manufacturers might not take certain auxiliary

machines, although they improve the quality of the Goodyear work but they would attempt to get along without such machines at all. The United Company wants each lessee to have all the kinds of auxiliary machines he needs in order that his work may be as perfect as possible and in order to increase the productivity and capacity of the welter and stitcher. By leasing the auxiliary machines without additional royalty the lessee is encouraged to use them and this improves his product, enhances the reputation of the Goodyear shoe and Goodyear machines, and increases the capacity of the welter and stitcher.

For a more complete discussion of the reasons for the adoption of the clause, see Main Brief, pp. 375–378.

The Auxiliary Restricted Use Clause was adopted by the Goodyear Company to accomplish the above reasonable and proper results. It was continued by the United Company for the same reasons which led to its adoption. It is a normal reasonable agreement adapted to accomplish a legitimate business purpose, and apart from any consideration of patent rights it is clearly lawful.

Furthermore, for the same reasons given above in respect to the Restricted Use Clause, it does not restrain trade, since it merely grants the lessee patent rights he did not have before and in no way restricts his previous freedom of action (*supra*, pp. 141–142), and it is a valid grant of a limited patent license and the control of patented machines which have never been sold and are still within the limits of the patent monopoly, and it, therefore, constitutes a lawful exercise of patent rights (*supra*, pp. 143–151).

K. Factory Output Clause.

In the fall of 1904 the United Company adopted a form of lease under which the initial payments theretofore required on its Goodyear machines were eliminated. This represented a very substantial reduction in charges. Partly to compensate the company for this reduction, it charged under this new form of lease a royalty based on the total number of welt shoes made by the lessee in his factory, whether or not made on its machines. In other words, when a lessee took its machines without initial payments, such lessee agreed to pay a royalty for the use of the machines based on the total number of shoes on which such machines were capable of use, whether so used or not. If the lessee did not wish to pay on this basis, he could take the former lease under which initial payments were charged (see Main Brief, pp. 422–424).

The United States insists that this royalty constitutes a charge for shoes manufactured on competitor's machines. This is not true. It is a royalty paid solely for a lease of the United Company's machines and is based on the amount of use which the lessee has for such machines. Furthermore, as stated, the lessee can take a lease without this clause if he prefers.

This Factory Output Clause was employed by the McKay Company in its heeling leases (*supra*, p. 89).

L. Clicking Machine Royalty.

The clicking machine is not restricted to use with any other machine under any form of lease. A small royalty based on the amount of dies used on the machine is charged.

If used with the United Company's welter and stitcher, or turn machine, and lasting machine, no further royalty is charged. In such case the total royalties received from the series is deemed sufficient compensation. If used with a welter and stitcher, or turn machine, or lasting machine not obtained from the United Company (which the lessee is free to do), an additional royalty is charged. In other words, the rate is less when the machine is used as part of a series of the United Company's machines.

The United States terms this a penalty for using the competitor's machines. It is, in fact, only a wholesale rate for the use of a series of machines, the lessee being free to use the machine either as part of a series or not as he prefers.

The insistence of the United States that this clause is unlawful shows that its real contention in respect to the leases is that machines must not be leased as a series for a wholesale royalty, but that each machine must be leased separately for a separate royalty.

For a discussion of this clause, see Main Brief, pp. 424–426.

6. ENFORCEMENT BY THE UNITED COMPANY OF ITS LEASES.

The United Company has treated its lessees with the utmost liberality and has enforced its leases only when it was treated with flagrant unfairness. A lessee who has treated the United Company fairly and who has used its machines so as to afford it a fair return has never been harassed because of a technical violation of his leases. Mr. R. P. Hazzard, a large shoe manufacturer, expressed the

true relation between the United Company and its lessees when he testified:—

> "I have never taken as much interest in the legal wording of the United Company's leases as I have in the personality of its people, and I have always had fair treatment from the United Company" (R. Vol. 1, p. 653, lines 17–20).

As stated, the United Company has never taken advantage of its technical rights under the leases and has enforced them only when it was treated unfairly and did not receive a fair return for its machines. In spite of extraordinary efforts to prove the contrary, the United States utterly failed to show a single instance of any arbitrary enforcement of the leases (see Main Brief, p. 429; App. II, pp. 743–807).

Apart from bankruptcy, it has cancelled its leases in only five instances during the period of more than twelve years in which it has done business, and in each case the lessee had either ceased using its machines at all or was dishonestly using them without paying royalty (see Main Brief, pp. 429–430).

On the other hand, the record shows instances in which it did not take any action, although it would have been fully justified in so doing (see Main Brief, pp. 430–431).

The following instances illustrate the extent to which the United Company has treated its lessees far more liberally than was required by the leases, thus showing that the clauses in the leases were intended only as protection in case it did not receive a fair return.

A. The United Company has furnished the service which we have discussed above to its lessees, costing it more than $1,000,000 a year, although not required to do so by the leases (see Main Brief, p. 427).

B. It has not required lessees to pay the full cost of repairing machines upon their return, although the leases require such payment (see Main Brief, pp. 427–428).

C. As new or improved machines have been invented the United Company has substituted them for outstanding machines without charge to the lessee and has scrapped the old machines although under no obligation to do so (see Main Brief, pp. 189–190, 428).

This, of course, has been an enormous expense to it.

D. The United Company has supplied all new auxiliary machines without charging additional royalty although under no obligation to do so (see Main Brief, pp. 377, 428).

E. The United Company has enforced the clause requiring minimum payments only for the purpose of requiring a lessee to return idle machines which were earning no royalty (see Main Brief, pp. 311, 428).

F. The United Company has permitted lessees to return machines for which they had no use, to change from one form of lease to another (Main Brief, pp. 306, 311, 430), and has offered to permit a lessee to give up his leases and take machines from a competitor when circumstances justified (Main Brief, pp. 359, 430).

7. COMPLETE FAILURE OF UNITED STATES TO PROVE THE CHARGE IN THE PETITION IN RESPECT TO THE LEASES.

We have above discussed the leases as though it were open to the United States to contest their legality on any ground it pleases. The leases, however, are really material in this case only in so far as they prove the charge made by the petition.

The charge made by the petition is that the defendants planned (1) to acquire all concerns engaged in the shoe machinery business; and (2) to refuse to lease welting, stitching, lasting, heeling, and metallic machines which the petition refers to as essential machines, unless the shoe manufacturer took practically all other machines from them (Main Brief, p. 235). The leases are alleged to be only a step in carrying out this plan and are relied on by the United States to prove the second part of the charge.

In other words, the charge is this: (1) The defendants planned that the United Company should take over the machines made by the constituent companies, viz., welting, lasting, metallic, and heeling machines, which are described as essential machines and of which the constituent companies had lawful patent monopolies; (2) that they also planned to acquire concerns making all other types of machines which were not essential; and (3) that they then planned to use the essential machines to force shoe manufacturers to take such other types of machines, such as General Department machines, etc., by refusing to lease the essential machines unless the shoe manufacturer also took such other types.

As the District Court pointed out (R. Vol. 1, p. 1163), the only clauses in the leases on which the United States relies as having this effect are the Restricted Use Clauses.

That the Restricted Use Clauses do not have this effect is conclusively shown by the fact that unrestricted leases are also offered lessees. But further than this, even if leases containing the Restricted Use Clauses were the only leases offered, and even if they did compel a shoe manufacturer taking machines of one department to use machines of other departments, they do not have the effect which the petition alleges. As we have shown, they do not restrict the use of

the so-called essential machines, viz., welting, lasting, metallic, and heeling machines to use with other types of machines. On the contrary, with one minor exception in the case of the No. 5 Lasting Machine, all the restrictions either (*a*) limit the use of certain so-called essential machines to use with other essential machines or (*b*) limit the use of other machines such as General Department, eyeletting, pulling-over machines, etc., to use with the essential machines. Whatever their effect, therefore, it is obvious that they do not require a shoe manufacturer taking the so-called essential machines to take other types.

For a fuller discussion of the complete failure of the United States to prove the charge in the petition as to the leases, see Main Brief, pp. 244–247.

V.

THE ACQUISITIONS OF OTHER CONCERNS AND PATENTS.

The petition alleges that in pursuance of the defendants' unlawful plan to acquire all concerns engaged in the shoe machinery business the United Company "absorbed many competitors" (R. Vol. 1, p. 999). It then recites *58 transactions which it alleges were of this character, and concludes,—

> "The competition which previously existed between said several concerns has been entirely destroyed" (R. Vol. 1, p. 1023).

1. COMPLETE FAILURE OF THE UNITED STATES TO PROVE ANY ATTEMPT TO ACQUIRE COMPETITORS OR ANY ATTEMPT TO ACQUIRE ALL CONCERNS ENGAGED IN THE SHOE MACHINERY INDUSTRY.

Instead of showing, as alleged in the petition, that 58 competitors engaged in the shoe machinery business were absorbed, the record shows conclusively that in none of

* The Plant purchase is the only transaction which involved any considerable number of patents or any substantial consideration. As the United States has for this reason laid great emphasis on this transaction, we consider it separately (*infra*, pp. 182–196). The allegation in respect to the Boston Blacking Company was withdrawn (R. Vol. 1, p. 47, lines 21–43).

the 58 transactions put in evidence was any competing shoe machinery business of any significance acquired.

1. In 9 of the 58 transactions no tangible property or business of any kind was acquired. These 9 transactions consisted of mere employment contracts, agreements commuting or settling prior obligations, or the acquisition of patent licenses or patents covering new inventions which the United Company wished to use. No shoe machines or shoe machinery business was acquired by any of these transactions (see Main Brief, p. 456).

2. By 15 of the remaining 49 transactions the United Company acquired the businesses of furnishing supplies of various kinds such as wire, eyelets, McKay needles, Goodyear needles, awls, mallets, tacks, nails, brushes, heels and counters, peg-wood, and a few mere tools. None of these transactions related to shoe machinery at all. In no case was the acquisition made for the purpose of eliminating competitors, and in each case the United Company acquired something it did not have before. Of course no shoe machines or shoe machinery business were acquired in any of these transactions (see Main Brief, p. 457).

3. In 8 of the remaining 34 transactions the party from whom the shoe machinery was acquired was not engaged in business but merely had a patented experimental machine. By 7 of these transactions the United Company acquired new machines which it did not have before, or patented inventions for the purpose of embodying them in its own machines. In the remaining transaction the United Company acquired control of patents which properly belonged to the McKay Company, and which the McKay Company, prior to the formation of the United Company, had brought suit to recover. By none of these transactions

was a company engaged in the shoe machinery business acquired (see Main Brief, p. 460).

4. In 17 of the remaining 26 transactions the United Company acquired a new machine or new machines for performing operations for which it did not have any machine at the time (see Main Brief, p. 463).

5. By 7 of the remaining 9 transactions the United Company acquired patented improvements or inventions for the purpose of enabling it to supply better machines than it had before (see Main Brief, p. 464).

6. The two remaining transactions related solely to foreign business in patented machines and were in effect merely purchases of foreign patents (see Main Brief, p. 465).

An analysis of the transactions thus shows that by all of them in which any property or business of any kind was acquired, the United Company acquired something it did not have before.

In a very few cases there was a slight overlapping of the field of a machine or business acquired with that of the United Company, but in every such instance either the United Company's machine or product was very inferior and unsatisfactory and was discarded when the new machine was acquired, or the acquisition of the overlapping machine or product was merely incidental to the transaction, entirely outside of its real purpose and object, and such slight competition, if any, as existed was of no significance in the trade. In every one of these transactions the important fact bearing both upon the intent and what was actually accomplished was that the United Company acquired a new machine or new product which it did not have before, but which its customers used, or a new invention which was needed to improve its machines.

The District Court, referring to the comparatively few instances in which any possible appearance of competition existed, said:—

> (R. Vol. 1, p. 1139.) "The instances then remaining in which the United Company was at the time producing or trying to develop for production a patented machine for doing work more or less similar to that for which the invention of the machine acquired was intended, are the only ones capable of being regarded as of any possible significance for the purposes of the petitioner's case. In all such cases it appears that the acquisitions made were of patented improvements, whether or not embodied in an actual machine, enabling the United Company to increase the efficiency of its own machines, or to complete the development of others with which it was then experimenting or had not yet succeeding[ed] in rendering commercially successful.
>
> "No case, however, is found among the acquisitions of the character last described wherein it has fairly been made to appear that actual competition existed between the device or machine acquired and any machine then being produced or experimented with by the United Company, of such consequence as justifies either the conclusion that the acquisition was for the purpose of suppressing such competition, or the conclusion that a material restraint of trade was thereby accomplished. In most of the cases of this sort the machine or device acquired was claimed to infringe patents belonging to the United Company, or the patent acquired was one which some machine belonging to it was claimed to infringe, or the application acquired was in interference with applications of its own; and the object of the acquisition is shown to have been the avoidance or compromise of pending or threatened litigation. In such cases it is still less possible to say that any wrongful absorption of a 'competitor's' business has been proved."

This finding of the District Court is fully sustained by the evidence.

An examination of those 58 transactions shows, therefore, that the United Company did not actually acquire or absorb any concerns offering competition of any significance whatsoever. The record further shows conclusively that the United Company did not attempt to acquire competitors or to acquire all concerns engaged in the shoe machinery business as charged in the petition.

During the period in which these transactions took place the United Company was offered and declined to purchase over 75 different concerns, many of them of large size and importance, engaged in furnishing shoe machinery and supplies (see Main Brief, p. 448). It also was offered and declined to purchase during the period from June, 1904, to December, 1911, alone, 493 inventions. A considerable portion of the so-called acquisitions consisted merely of the purchase of inventions of the same kind as the 493 so offered for sale and declined (see Main Brief, p. 450). In addition there are numerous other manufacturers of shoe machinery which the United Company made no attempt to purchase. Defendant's Exhibit 336 contains a list of 125 shoe machinery manufacturers who, between them, manufacture every kind of shoe machinery made (see Main Brief, p. 449). Appendix III to the Main Brief (Main Brief, pp. 808–834) contains a summary of the testimony of shoe machinery manufacturers representing 48 different concerns which manufacture machines which compete with one or more of the machines furnished by the United Company.

Many of the concerns which were offered to the United Company and which it declined to purchase were large concerns. Some of them furnished complete lines of

machines and were active competitors of the United Company. The list includes, among others, the following (see Main Brief, pp. 448–9):—

The Duplessis Company (now the Hamel Shoe Machinery Company), which furnishes a complete line of machines for making welt and turn shoes and which has done a large business.

The Haverhill Shoe Machinery Company, which is prepared to furnish a complete line of machines "whether it is for welts or McKays or turns or pegs or anything else."

The R. H. Long Co., which is prepared to furnish a complete line of machines for welt or turn shoes.

The Union Lockstitch Co., which made and marketed large numbers of outsole stitchers.

The Wheeler & Wilson Company, which manufactured 90 per cent. of the machines used in making uppers.

The list of concerns which the United Company declined to purchase includes concerns making machines of practically every kind used in the manufacture of shoes. For a statement of the business done by these concerns, see Mr. Winslow's testimony, R. Vol. 1, pp. 472–476.

The evidence thus shows conclusively that the United Company neither acquired nor attempted (1) to acquire all concerns engaged in the shoe machinery business, or (2) to acquire all concerns engaged in making bottoming machines, *i.e.*, machines of the character to which the case has been limited, or (3) to acquire such concerns as competed with it.

The findings of the District Court to this effect (see Main Brief, p. 450) are thus fully sustained.

This being so, the so-called acquisitions have no significance in the present case.

However, in order to illustrate further the true character of these acquisitions, we wish to point out briefly in this summary:—

(*a*) Certain characteristics of the shoe machinery industry and the development of that industry by the United Company in order to show clearly why these acquisitions were made.

(*b*) The insignificant character of most of the transactions and the comparatively insignificant effect on the shoe machinery industry of these acquisitions.

(*c*) The complete failure of the United States to prove its allegations that plants have been closed and businesses discontinued, that exorbitant prices were paid, and that letters patent have been acquired and not used.

A great mass of evidence was introduced with reference to these various transactions. They are so numerous that we cannot in this summary analyze the evidence in respect to each. A statement and analysis of their character is contained in our Main Brief, pp. 436–490; and Appendix I (Main Brief, pp. 655-739) contains an index of the various transactions and a statement of the evidence relating to each transaction with references to the record.

2. REASONS FOR THE ACQUISITIONS.

The reasons for the acquisitions cannot be thoroughly understood without an understanding of the situation of the United Company at the time of its formation and of the character of the shoe machinery industry and its development since that date.

When the United Company was formed:—

(*a*) It had a comparatively small number of machines for performing an equally small number of operations. It did not have machines for performing numerous of the total number of operations which must be performed in the manufacture of each shoe (R. Vol. 1, p. 2, lines 10–22; p. 3, lines 15–19; p. 4, lines 23–27). Its machines were largely adapted for welt work and not for other classes of work (R. Vol. 1, p. 48, lines 35–38). As an example of the limited number of its machines it had no General Department machines, of which it now furnishes over 170 different types.

(*b*) The United Company's own machines, while the best made and for this reason used almost exclusively for the operations they performed, were still capable of great improvement if time and money were expended in invention and experimentation. Such improvement would consist almost entirely of the addition of inventions to machines on which the United Company held dominating patents. No one but the United Company could, therefore, make improvements in machines of the type which it manufactured and offer them to the public.

As an example of the extent to which the United Company's machines have been perfected and developed by the addition of patented improvements, it may be noted that the Model K Welting Machine is a combination of the inventions of 25 patents made at different times, the Outsole Stitcher, of the inventions of 22 patents, and the No. 5 Slugging Machine, of the inventions of 20 patents. All of the important machines represent a number of patents combined to produce the most effective possible machine.

(*c*) There were in 1899 many operations performed by hand. It was possible and probable that, by the expendi-

ture of money in invention and experimentation, machines could be developed for performing many of these operations.

(*d*) The United Company in 1899 furnished no supplies of the many different kinds used by shoe manufacturers. As it developed its service system and established its stations in various places in the shoe manufacturing districts, it was possible for it to keep at them such supplies for quick delivery to shoe manufacturers, to furnish these supplies more cheaply than a concern which sold no machines and only one or two classes of supplies, and to furnish supplies which were especially adapted for use with shoe machines.

The United Company, upon its formation, was confronted with the question whether it would remain content merely to put out the machines it had acquired from the constituent companies in the stage of development in which they then were, or whether it should use its best endeavors to advance the art of shoe machinery by improving its own machines, by inventing new machines to assist its principal machines and to do work then done by hand, and by furnishing shoe manufacturers through its service station with supplies which would be a distinct convenience to them and assist in the effective conduct of the shoe manufacturer's business.

The defendants realized that the art of shoe machinery had been created and developed largely by the constituent companies because of their constant efforts to invent and improve the classes of shoe machinery they manufactured. They realized that there was opportunity for enormous improvement in the shoe machinery of that day and in the development of new machines; they owned the best bottoming machines and were the only persons who could

improve these machines, and they realized that with their knowledge of the industry and their resources they were best equipped to develop new machines.

Accordingly they undertook this work of experimentation and development. We have already shown how in the comparatively short period of twelve years by a liberal and wise expenditure of money in inventive work the United Company has improved the efficiency of machines manufactured in 1899 to such an extent that, due to this cause and the improved service the United Company renders, each welter produced 66.7 per cent. more shoes in 1910 than in 1899; each stitcher, 69.5 more shoes; each heel-attaching machine, 62.3 more shoes; and each lasting machine, 24 per cent. more shoes (*supra*, pp. 67–68). We have also shown how during this short period the United Company developed 150 new machines, 39 of which perform work previously done by hand (*supra*, pp. 65–66).

Most of the inventions embodied in these new and improved machines were the product of the United Company's own Inventive Department. Occasionally in the progress of this work, however, the United Company found that some other person owned an invention which could advantageously be added to one of its many machines and it acquired such invention, or it found that after it had developed an improvement such improvement infringed a patent owned by another person, or it found that in developing a new machine the acquisition of some patent was necessary or advisable to produce an effective result. As illustrating the extent to which the United Company's machines combine its own inventive work and the inventions of others, the Model K Welter embodies inventions of 19 patents developed by the United Company and 6

patents acquired from others; the Outsole Stitcher, 17 patents developed by the United Company and 5 acquired from others; the No. 5 Slugging Machine, 17 patents developed by the United Company and 3 acquired from others; the Universal Channeling Machine, 8 patents developed by the United Company and 3 acquired from others; the Ensign Lacing Machine, 5 patents developed by the United Company and 4 acquired from others; the Star Channel Cementing Machine—Model D, 3 patents developed by the United Company and 1 acquired patent (see Main Brief, p. 443).

The United Company also acquired from time to time machines which it did not manufacture at the time and which it desired to furnish shoe manufacturers. Most of these machines were General Department machines and were either sold or leased by the United Company at the option of the shoe manufacturers. The purchase of these machines was of benefit to the shoe trade, since the United Company could manufacture the machines more economically and furnish with them efficient service, which previously had not been furnished at all with these machines. In addition, the United Company from time to time acquired the business of furnishing various supplies to its customers.

In most of the acquisitions the United Company acquired a single patent, a single machine, or a single supply, such as peg-wood, needles, or brushes. In none of them, except the Plant purchase considered below, did it acquire any large number of patents or did it acquire any large number of machines.

Disregarding for the present a number of transactions, such as employment contracts by which no property was

acquired, and which were not acquisitions at all, the record shows that the acquisitions were not made for the purpose of monopolizing shoe machinery or eliminating competitors, and that they had no such effect, but that they were made for the following purposes:—

1. To enable the United Company to furnish its customers with supplies which the United Company did not manufacture at the time.

2. To enable the United Company to furnish to its customers patented machines for performing operations for which it had never before had any machines.

3. To assist the United Company in developing entirely new machines upon which it was experimenting. The result in each such case was a better machine than could have been developed by the United Company or such other person if the patent or patents of such other person had not been combined with those of the United Company.

4. To enable the United Company to add some improvement to the machines it was then putting out. In every such instance the acquisition of such patented improvement enabled the United Company to produce a more efficient machine than would have been possible in the industry if such patented improvement had not been acquired and had not been combined with its own patents.

As stated above, the United Company made a number of acquisitions because the patent or patents thereby acquired stood in the way of some development made or planned in its own machines. In several cases the machine acquired infringed the United Company's patents or some patent application was in interference with a patent application of the United Company. By such acquisitions expensive and annoying patent litigation was avoided,

and in some cases the use of inventions became possible at once, the use of which might otherwise have been delayed for years pending the outcome of patent litigation. In all of the cases in which the United States may urge there were any apparently competing machines acquired, patent litigation was settled (see Main Brief, pp. 472–4).

3. COMPARATIVELY INSIGNIFICANT EFFECT OF THE TRANSACTIONS UPON THE CLASSES OF MACHINES AS TO WHICH MONOPOLY IS NOW CHARGED.

In 44 of the 58 transactions the United Company did not acquire any machine which is within the class of machines as to which monopoly is now charged (see Main Brief, p. 470).

While in some of the remaining transactions the United Company acquired useful machines which it did not manufacture before, or patents which effected substantial improvements in its machines, such acquisitions, when compared with the remarkable inventions which the United Company developed itself and the new machines which it produced itself, are of comparatively insignificant importance.

Had the United Company not acquired any of these machines and patents and had they all been combined together in one company, while the United Company would have been prevented from making substantial improvements in its machines and from putting out a number of types of machines which it did not manufacture, there is not the slightest foundation in the record for a contention

that such new company upon making such acquisitions would have had machines which competed or were capable of competition in any significant sense with the United Company's machines.

The District Court held:—

> "Taken together, the acquisitions of this class [namely, the class in which any possible competition could be charged] are, in importance and amount, only of a consequence relatively small in proportion to the entire field then lawfully belonging to the United Company. It does not appear that they contributed anything essentially important to that degree of commercial success obtained by the company as above. If they assisted in obtaining it, it was by assisting the development of the machines to whose ultimate efficiency it was due. It can hardly be said as to any of them that they afforded anything more than a basis whereon to build. Speaking of them generally, it may be said that the invention or machine obtained required further development in the company's hands before it could be properly used" (R. Vol. 1, p. 1140).

4. THE UNITED COMPANY DID NOT PAY EXORBITANT PRICES FOR THE ACQUISITIONS.

The petition alleges that the defendants paid exorbitant prices for these acquisitions (R. Vol. 1, p. 999).

There is not a suggestion in the record that in any instance more was paid than the property was worth.

During the period from 1907 to 1911 the United Company paid for concerns which could be said to be doing a shoe machinery business $375,000. During the same period it expended in its Experimental Department $2,267,000 (see Main Brief, p. 454).

The District Court held that this allegation was neither proved nor seriously urged (R. Vol. 1, p. 1142).

5. CONTENTION THAT PLANTS HAVE BEEN CLOSED AND BUSINESS DISCONTINUED.

The petition alleges in respect to a number of acquisitions that plants were closed and the business discontinued.

In only 6 transactions did the United Company acquire any real estate at all. In none of these instances did the United Company acquire any machines as to which monopoly is charged. As to five of these instances, three of which involved the manufacture of supplies, and one of treeing machines, the business was continued and is still carried on in the same plants as previously. In the sixth case the business was so carried on for a period and then for convenience transferred to the United Company's plant at Beverly (see Main Brief, pp. 481–2).

The petition alleges that patents were acquired, but not used, thus depriving the public of the benefits arising therefrom (R. Vol. 1, p. 999). There is not the slightest evidence to support this allegation (see Main Brief, pp. 474–5). On the contrary, the record conclusively disproves it.

6. CONCLUSION AS TO THE ACQUISITIONS.

As we have shown above, the record conclusively establishes and the District Court found that the concerns acquired were not competitors; and that the acquisitions were not made for the purpose of eliminating competitors or for the purpose of acquiring all concerns engaged in the shoe machinery industry. The acquisitions, therefore, do not prove the existence of the unlawful project charged

in the petition; they were obviously not steps taken in pursuance of any such plan and they are, therefore, immaterial in the present case.

Nor were they unlawful from any other point of view.

As we have seen, they were made to enable the United Company to furnish some supply, some patented machine, or some patented improvement which it did not have before. They were plainly a mere continuation of that "effort after greater efficiency" which was the purpose of the formation of the United Company and which was approved by this Court in *United States* v. *Winslow*, 227 U. S. 202. Such "effort after greater efficiency" naturally resulted in the United Company's increasing the number of types of machines and supplies which it furnished and in improving its machines from time to time as opportunity to do so offered.

That such acquisitions of new and non-competing types of machines, patents, or supplies is lawful was established in *United States* v. *Winslow*, supra. This Court said in that case (p. 217):—

> "On the face of it the combination was simply an effort after greater efficiency. . . . The disintegration aimed at by the statute does not extend to reducing all manufacture to isolated units of the lowest degree. It is as lawful for one corporation to make every part of a steam engine and to put the machine together as it would be for one to make the boilers and another to make the wheels."

By the original formation of the United Company the non-competing businesses of manufacturing welting, lasting, heeling, and metallic machines were combined in one company. By the later acquisitions which we are now

considering something new, not previously owned by the United Company, was acquired. Compared with the importance of the machines combined at the formation of the United Company, such acquisitions, however, are comparatively insignificant. The formation of the United Company being lawful, as this Court held, these acquisitions are unquestionably lawful and proper.

In certain of the acquisitions the United Company was at the time, in the language of the District Court, "producing or trying to develop for production a patented machine for doing work more or less similar to that for which the invention of the machine acquired was intended" (R. Vol. 1, p. 1139).

These are the only cases in which it can possibly be contended that there was any possibility of competition. In practically all of these cases the United Company acquired, as we have stated, something new that it did not have before, and in all of such cases it settled patent litigation or infringements, which if not settled would have retarded the development of its machines.

It may be contended that in some of these cases the owner of the machine or patent so acquired might have developed it or sold it and competed with the United Company. In practically every case this is a mere speculation. The District Court found that no actual competition of any significance was eliminated by any of those transactions (R. Vol. 1, pp. 1139–1140).

When it is remembered that in practically every such case the United Company acquired a patented improvement enabling it to improve or develop some machine, that most of the acquisitions did not relate in any way to machines as to which monopoly is charged, and also that the

United Company did not acquire any of the concerns actively competing with it, although many of them, its most important competitors, were offered to it for sale, it is impossible to believe that these acquisitions were made to eliminate a possibility of future competition.

But if there was a speculative possibility of competition in any of these instances between the owner of the patent or machine acquired and the United Company, it must be remembered that the Sherman Act does not condemn a transaction merely because some competition, speculative or even actual, may incidentally be eliminated. Every partnership of two persons engaged in commerce would in such case be condemned. To be illegal the transaction must be undertaken for the purpose of eliminating such competition, or must result in some undue or unreasonable restraint of competitive conditions or obstruction to the natural course of trade which prejudices the public interests.

In *Nash* v. *United States*, 229 U. S. 373, the Court said (p. 376):—

> "Those cases may be taken to have established that only such contracts and combinations are within the act as, by reason of intent or the inherent nature of the contemplated acts, *prejudice the public interests* by unduly restricting competition or unduly obstructing the course of trade" (italics ours).

See also quotation from *Wilder Mfg. Co.* v. *Corn Products Co.*, 236 U. S. 165, at p. 487 of the Main Brief.

Where two persons own patents under which each can manufacture an inferior machine, and by a combination of the two patents a superior and more efficient machine can be constructed, obviously the public interest is not prejudiced by the acquisition for this purpose by one of

the patentees of the other patent, even if some competition between the inferior machines is thereby incidentally eliminated. The outstanding fact in such a transaction is that the public gets a superior machine. As the Sherman Act is intended to prohibit only such contracts as prejudice the public interest, it surely does not condemn such a transaction.

Take the telephone as an example. In *United States* v. *American Bell Telephone Company*, 167 U. S. 224, the right of a patentee to acquire other patents which improve his apparatus, although thereby his monopoly is extended, was affirmed as undoubted. The Court said (p. 249):—

> "Much is said in the briefs and in the arguments about the practical continuance of the telephone monopoly. It is well to understand exactly what is meant thereby. No one questions that the Bell patent has expired, and that all of his invention is free to the use of the public. It is not denied that Berliner's invention is something independent and distinct from the Bell invention. It is the combination of these inventions with those of Blake and Edison which makes the instrument in commercial use, and because this is the most serviceable it is the one that the public insists upon having. But each invention has independent rights. It loses nothing because when united with another it results in an instrument more valuable than either alone will give. Suppose that at the expiration of this Berliner patent some new invention shall be made by which in connection with those already free to the public an instrument can be manufactured far surpassing in utility that used today, and the Bell Company shall purchase that invention, the public, which always insists on having the best and most serviceable, will undoubtedly take the new instrument, and in that way it may happen that what is called the telephone monopoly is practically still further continued. But surely that does not abridge the legal rights of anyone.

> The inventor of the latest addition is entitled to full protection, and if the telephone company buys that invention it is entitled to all the rights which the inventor had."

It appears from that case that the telephone as it then existed embodied a combination of four patents. Bell's invention was the fundamental invention. The others were improvements which had been made from time to time. After the expiration of Bell's patent, a telephone could have been constructed by the addition of either one of the improvements. Can it possibly be contended that the owners of those new inventions, although there would possibly or probably have been competition between them if they had remained separate, could not combine and by the use of all their patents make a more perfect instrument? We think it clear from the language of the Court that such a combination was permissible.

One further consideration should be borne in mind with reference to the acquisition of patents and patented machines. A business dominated by patents, like the shoe machinery industry, is quite different from an unpatented industry. In an unpatented industry, like the oil business, or the tobacco business, every one is free to engage in the business and free to enlarge his plants, or construct new plants, and thus satisfy the demands of all his customers without acquiring the property of any other concerns engaged in the business.

In a business like the shoe machinery business no one can engage in it unless he can produce machines as good as or better than those produced by some one else making the same class of machines. No one wants machines representing the stage of development in the industry which was

reached seventeen or more years ago. Furthermore, for the same reason, no one can continue in the business unless his machines continue to be as good as those made by others. The result is that a shoe machinery manufacturer may find he must purchase patents enabling him to make modern machines, or go out of business. For example, take a manufacturer who makes a patented heeling machine. Another person obtains a patent or patents which enable him to manufacture a superior machine. The result is that the machine of the first manufacturer will in time become obsolete, just as the Ideal Lasting Machine has become obsolete, and he will be driven out of business unless he can acquire the right to furnish the new machine, which he can only do by acquiring the patents; in other words, by buying the business of the second manufacturer, which, of course, is dependent upon and follows such manufacturer's patents.

Surely the first manufacturer is not required by law to see his business disappear and to refrain from buying the patents embodied in the superior machine, because thereby competition between his inferior machine and such superior machine may be incidentally eliminated. The superior patents lawfully restrain him from competing on equal terms. In acquiring them he is not imposing any restraint on commerce which it is the purpose of the Sherman Act to prevent. He is, on the contrary, merely removing a restraint which prevented his offering the best machine and the machine which his customers desire.

VI.

THE PURCHASE OF PLANT'S PATENTS AND INVENTIONS.

In September, 1910, the United Company acquired the patents and inventions of Thomas G. Plant. In the same transaction it acquired from Plant 60 per cent. of the capital stock of the Thomas G. Plant Company, a corporation manufacturing women's shoes.

The United Company has laid great stress upon the Plant purchase, because it is the only acquisition made by the United Company involving patents relating to any considerable number of machines and involving a substantial purchase price. Except that the patents thereby acquired were of great value, and, when incorporated into the United Company's machines, resulted in the greatly increased efficiency of a number of machines, whereas the other transactions were mostly concerned with a single patented improvement or machine, the Plant transaction did not differ from the more or less insignificant transactions which we have considered above. As the District Court found and the record abundantly proves, it was not made to eliminate a competitor, but to enable the United Company to incorporate the Plant patented improvements in its superior machines and to settle a vast amount of threatened and pending patent litigation which would have seriously interfered with and retarded the development of the United Company's machines.

It is not unimportant to note that this transaction upon which so much reliance is placed by counsel for the United States took place over eleven years after the formation of the United Company. The acquisition of the Plant patents eleven years after the formation of the United Company, even if this transaction were of the character which the United States alleges, would, considered by itself, have little significance in proving the unlawful project charged in the petition which it is stated was formed in 1899.

Plant had constructed a number of experimental machines embodying his inventions and had installed them in the shoe factory which he controlled where women's shoes were made exclusively, the factory of the Thomas G. Plant Company. He had not put any machines into any other factory. It should be clearly understood that the Plant machines which are mentioned in the record, and which we shall hereafter refer to, were not machines that Plant had to sell or machines that the United Company purchased. Those machines had been bought and paid for by the Plant shoe manufacturing concern and they were not for sale. Their only importance in this case is that they were concrete evidence showing how much or how little Plant had accomplished in producing machines, and that they contained his valuable inventions.

1. PLANT WAS NOT A COMPETITOR.

Plant was not a competitor of the United Company. He did not own any factory for manufacturing machines; he was not carrying on any shoe machinery business and he was not prepared to supply any machines. He declared

that he did not want to go into the shoe machinery business, that he desired to retire from business; and after the purchase he did retire. There is uncontradicted evidence showing that the sole purpose of the Plant enterprise was to create something which he could sell to the United Company. He so stated himself and the history of his negotiations with the United Company proves this to be the fact. He offered a large commission—$250,000 and later $500,000—to an influential shoe manufacturer if he succeeded in effecting a sale to the United Company, and he later offered and had to pay a commission of 5 per cent. to another intermediary who undertook to effect a sale to the United Company (see Main Brief, pp. 515–517).

The record establishes that the Plant machines were crude, really in the experimental stage, entirely useless for men's shoes and unfit for the making of women's shoes; that in their use in the Plant shoe factory they were constantly breaking down; that they broke a great number of lasts; that it was necessary to employ a large number of men to repair shoes that were defective on account of the poor work of the machines; that it cost three and a quarter cents per pair more to make shoes on them than it cost on the United Company machines; that the profits of the Plant shoe business after the Plant machines were installed were one-half less than they had been when the United Company machines were used; that the machines could not be used for manufacturing shoes according to the methods universally followed by other shoe manufacturers; and that after the purchase the managers of the shoe factory, Plant's former associates, found it impracticable to continue the manufacture of shoes with Plant's machines and of their own volition discontinued the use of those machines and

substituted United Company machines. This evidence was almost entirely uncontradicted. After it had been introduced, the United States made no effort in its rebuttal case to meet this evidence.

The District Court found (R. Vol. 1, p. 1143):—

> "Whatever the merit of Plant's inventions, these machines in which he had first embodied them are not shown by the evidence to have been commercially successful in September, 1910, or to have been capable of such success in their then stage of development .... In the state in which the United Company took them over, they were not found capable of profitable use. Nothing is found in the evidence which affords reasonable support for the petitioner's contention that they were 'right at the threshold of extensive competition with the United Company.'"

For a more complete discussion of the evidence showing that Plant was not engaged in the shoe machinery business and that his machines were not commercially successful or capable of profitable use, see Main Brief, pp. 513–515, 517–534.

2. PLANT'S VALUABLE INVENTIONS.

On the other hand, in the course of his experimental work Plant had made or acquired many inventions which were embodied in his machines. Although their mechanical embodiments in Plant's crude machines were defective and unsatisfactory, the United Company's experts could see that many of those inventions were extremely valuable and represented very important advances in the shoe machinery art which would be of the utmost value if combined with the United Company's patents. These inventions were

broadly claimed in Plant's patents, and accordingly the United Company could not use the inventions without infringing his patents (see Main Brief, pp. 535–538, 541–550).

3. THE INTOLERABLE PATENT COMPLICATIONS.

Plant had, however, developed his inventions and constructed his experimental machines upon the foundation which for many years the United Company and its predecessors had been building; he had, in other words, added his improvements to old machines of the United Company. As Mr. Howe testified,—

> "He had taken our machines, whether he had a right to or not, and had made certain improvements on them" (R. Vol. 1, p. 669, lines 17–18).

Under these circumstances extensive infringement of the United Company's patents naturally occurred.

The testimony was uncontradicted that 37 of Plant's machines, including practically all of his important machines, infringed claims in 99 patents and 3 pending applications owned by the United Company amounting in the aggregate to 546 claims; and that many claims were infringed by more than one machine with the result that there were 708 distinct cases of infringement of the United Company's patents by Plant's machines (see Main Brief, pp. 551–553).

On the other hand, for several years Plant's inventive work had been going on simultaneously with that of the United Company's inventors, and in certain instances he had anticipated the United Company with the result that the United Company had unwittingly embodied in 15 of its

machines improvements which infringed Plant's patents. A number of its most important machines were involved, such as the latest model welter, the No. 5 lasting machine, and the latest models of heel-attaching machine and rounding and channeling machine (see Main Brief, pp. 553–554). There had also been declared by the Patent Office 23 interferences between patent applications owned by Plant and applications owned by the United Company. These involved improvements in important machines of the United Company, such as lasting, heeling, nailing, leveling, pulling-over, and other machines (see Main Brief, p. 554).

The details of this vast amount of patent infringement and conflict are more fully discussed in the Main Brief, pp. 541–542, 547, 550–556. It is unquestioned that Plant could not have used most of the important machines he had constructed, unsatisfactory though they were, since the United Company's patents would have prevented, and it is further clear that the United Company would not have been able to use many important improvements which it had developed independently, but which had been anticipated by Plant. The natural development of its machines on which it had expended large amounts of money would have been retarded until the expiration of Plant's patents many years later if the purchase of these patents had not been made. Furthermore, it would have been necessary for the United Company to withdraw from the hands of shoe manufacturers many infringing machines at great expense and to reorganize these machines and replace the infringing machines with the reorganized machines. In the meantime, its lessees undoubtedly would have been harassed by patent suits brought by Plant, and if he had obtained injunctions while they still held infringing machines they might have

been obliged to stop their entire production until the United Company was able to furnish them with new machines. In addition the United Company would have become involved in a vast amount of patent litigation which would not only have been expensive but which would have involved much of the time and attention of the United Company's officials and experts.

4. THE NEGOTIATIONS FOR THE PURCHASE.

The United Company had never sought nor even considered any purchase from Plant until overtures were made by Plant. The interviews resulting from those overtures were all sought by Plant and his proposals were several times declined without encouragement to renew them. Throughout the negotiations, which extended over three months, Mr. Winslow insisted that he would not consider the purchase unless there were opportunity for the United Company's experts to examine the Plant machines and determine the value of his inventions, and that he would consider purchasing those inventions upon no basis other than the value which they would have to the shoe industry and to the United Company in the advancement of the art.

After negotiations had several times been broken off by the United Company and renewed by Plant, he finally permitted its experts to examine the machines in the Plant shoe factory. As a result of the extended and thorough examination which was then made it was determined that while the Plant machines themselves were crude and unsatisfactory, Plant had made some very valuable inventions which could be incorporated in the United Company's machines with great advantage to the United Company and to its cus-

tomers. Accordingly, when Plant offered to sell those inventions at a much lower price than he had previously named, and offered also to include his valuable holdings in the shoe manufacturing company, the United Company accepted the offer.

The District Court found (R. Vol. 1, p. 1143),—

> "The evidence regarding Plant's negotiations with the defendants sufficiently proves that they were never sought by the defendants and that there was never any attempt on their part to get Plant to sell them his inventions or machines or anything else; but that, on the contrary, all the efforts toward such a purchase were made by him."

For a statement of the evidence with respect to these negotiations, see Main Brief, pp. 564–573.

5. THE VALUE OF THE PLANT PATENTS AND THE USE MADE OF THEM BY THE UNITED COMPANY.

The value of the Plant patents to the United Company is best illustrated by the use which was made of them.

The United Company has incorporated into 26 of its machines the inventions embodied in 43 of Plant's patents. It has improved and adopted 17 of Plant's patented machines (see Main Brief, pp. 538–539, 550).

The record abounds in testimony as to the increased efficiency of the United Company's machines by the addition of Plant improvements, the savings in material and other economies thereby effected, the increased output of

the improved machines, and the resulting increase in wages received by operatives who are paid by the piece.

The more important of the Plant inventions which were especially useful in the United Company's machines were those relating to the welter, stitcher, lasting machine, rough rounding machine and heel-attaching machine (Main Brief, p. 550).

The improvements in the welter and stitcher were the most striking and alone justify the purchase.

For the first time in the history of the industry Plant had embodied in a welt sewing machine means for cutting off the welt close to the end of the seam, means for holding the end of the welt in proper position to start on the next shoe with minimum waste of welting, a welt measurer which determined the amount of welt left on the shoe when it was cut off and positively prevented waste of welt, and, finally, means for automatically stopping the machine and casting off the last loop of thread from the barb of the needle. Always previously it had been necessary for the operator to stop the machine by putting his hand on the belt pulley, first slowing down the machine, then stopping it, and finally turning the machine backward at such time and in such manner as to free the needle from the last loop of thread, in order to free the shoe from the machine. Then with a hand knife he cut the welt. In starting with the next shoe he had to hold the end of the welt with his finger and this involved wasting about two inches of welting upon each pair of shoes, worth at least a quarter of a cent per pair and more on men's shoes (Main Brief, p. 536).

These improvements were of the utmost importance.

On the other hand, Plant's welter, incorporating his improvements, infringed a patent of the United Company

which covered broadly a welt holder but under which the United Company had never been able to produce a commercial welt holder. The result was a deadlock. Neither Plant nor the United Company, unless one acquired the patents of the other, could lawfully make use of this extremely important invention (Main Brief, pp. 541–542). Furthermore, the Plant welter, even when it embodied this infringing invention, lacked valuable improvements which were incorporated in the United Company's welter. Only by the incorporation of the Plant inventions in the United Company's welter could Plant's inventions be utilized to the best advantage. In adapting the Plant inventions to its machines, the United Company developed still further improvements (Main Brief, pp. 542–543).

The result was a new model of the welter embodying all these inventions and far superior to any machine previously produced. R. P. Hazzard testified that the previous machine produced 25 dozen shoes a day, and the new model 40 dozen, an increase of over 50 per cent. in capacity (Main Brief, p. 544). He further testified that in addition to this increased capacity the machine saved $500 to $600 a year in welting alone (Main Brief, p. 544). Blagden, an operator on welt machines, testified that although the piece price paid for work on the old machine was one-third more than on the new machine, he was, nevertheless, able to earn 20 per cent. more on the new machine (Main Brief, pp. 544–545).

The savings in welting and increased capacity on the new machine must therefore amount to at least $800 per year. On 2,527 machines, the number of welters the United Company had out in 1911, this would amount to over $2,000,000 annually when the machines were used throughout the year (see Main Brief, p. 545).

For a further discussion of the improvements in the welter, see Main Brief, pp. 536–537, 541–546.

Plant had made inventions for the stitcher which stopped the machine in proper position to remove the shoe and to receive another shoe. Before this, it had always been necessary for the operator to remove one hand from the shoe, stop the machine by hand, and then lift the presser-foot so he could remove the shoe and then lift the presser-foot in order to introduce a new shoe. All this work was eliminated by the Plant inventions, which, therefore, effected a great saving in time and in the effort required of the operator (see Main Brief, p. 537).

The incorporation of the Plant stitcher patents into the United Company's stitcher increased the efficiency of the machine to a remarkable extent and also greatly benefited the operators. Hazzard testified that the average piece price on the old model was 40 per cent. more than on the new model but nevertheless, due to the increased speed of the new model, the operator earned an average of 24 per cent. more wages (Main Brief, pp. 547–548).

These valuable Plant inventions when incorporated in the United Company's machines were furnished lessees without any increase in royalties, although they had cost the United Company $2,500,000, and although in the case of a number of machines, such as the welter and stitcher, it meant substituting new machines embodying the old and new inventions for the comparatively new machines then held by lessees (Main Brief, p. 550).

6. THE PLANT PATENTS WERE WORTH MORE THAN THE PRICE PAID FOR THEM.

For the Plant inventions and patents and for 60 per cent. of the stock of the Thomas G. Plant Shoe Company, a shoe concern which Plant had built up and which he made it a part of his offer to the United Company should be included with the patents, since he desired to get out of business, the United Company gave $3,000,000 cash and $1,500,000 par value of its stock, having a market value of twice the par value. In other words, it paid a total of $6,000,000 in cash and stock. Of this amount Mr. Winslow considered that $2,500,000 was paid for the Plant patents (Main Brief, p. 562).

The stock of the Plant Shoe Company was easily worth at least the balance of the purchase price, namely, $3,500,000. This company had earned an average of $738,000 a year for four years and in one year had earned $1,122,196.28 (Main Brief, p. 562). 60 per cent. of its average earnings capitalized at 10 per cent. gives a value of $4,428,000, leaving only $1,527,000 as the amount paid for the patents.

The patents were worth far more to the United Company and the public when combined with the United Company's patents than the amount paid for them. As we have shown, the improvements in the welter alone resulted in savings which were worth more than this amount.

7. CONCLUSION AS TO THE PURCHASE OF THE PLANT INVENTIONS.

The Plant purchase was made, as the District Court found, to acquire the valuable Plant patents in order to incorporate them in the United Company's machines and to avoid the intolerable patent confusion and litigation which would have otherwise resulted.

There is nothing in the record to justify a contention that this purchase was really made to eliminate competition. Plant was not competing, his machines were not capable of successful competition, and, owing to the infringement of the United Company's patents and their own weakness, it was at least questionable, if not improbable, that he would ever be able so to reorganize and develop them as to make them commercially successful. The United Company did not institute or press the negotiations for purchase, but merely considered Plant's repeated offers and when he offered to sell for a reasonable price the United Company accepted the offer.

Mr. Winslow testified in respect to his attitude during the Plant negotiations:—

> "My entire and only interest was whether those patents could be made of benefit to our customers and the trade. If they could be of benefit, if they were of large benefit, and the trade ought to have them, I should be very glad to buy them and embody them in our machines for what I thought they were worth, irrespective of what they had cost him—but I would not pay a cent more for them" (R. Vol. 1, p. 482, lines 26–32).

The District Court, after referring to the value of the Plant patents when combined with the United Company's patents and the litigation which threatened, said:—

> "The above reasons, none of them open to any charge of illegality, seem to me to have been the really operative reasons which must have induced the defendants to enter into the Plant bargain upon the terms which he finally offered them. They appear so adequate as legitimate business reasons for doing this as in my opinion to leave no reasonable ground for holding, against the defendants' denial, that it was really a purchase to suppress competition" (R. Vol. 1, pp. 1145–1146).

The purchase, therefore, cannot be held to be unlawful on the ground of intent. Nor can it possibly be held to have been inherently unlawful apart from unlawful intent. No actual competition was eliminated by the purchase, as Plant was not engaged in furnishing shoe machinery. There was only a possible or speculative competition in the event that Plant should be able in the future to avoid infringement of the United Company's patents and make his machines commercial.

On the other hand, it was of the utmost importance to shoe manufacturers generally and to the public that machines embodying the United Company's inventions and the Plant improvements should be produced. Only in this way could the best machines possible in the then stage of development of the art of shoe machinery be manufactured. And this result could only be accomplished by the acquisition of the Plant patents. Since the Sherman Act only condemns transactions which prejudice the public interests (*supra*, p. 178), it is clear that it does not condemn this transaction so obviously beneficial to the public

which has thus received the benefit of vastly more efficient machines than would otherwise have been possible without paying one cent more in royalties than was paid previously.

One test of the legality of the purchase is whether the public interest would be injured if the United Company now sold the Plant patents. Such a sale would mean that 26 of the United Company's machines would in the future be stripped of valuable inventions; that these machines would produce fewer shoes per day, and that shoe manufacturers would not be able to make the very large savings in material which is now possible; that shoe manufacturers would be obliged to pay higher piece wages since the capacity of the machines would be reduced, and operatives, even with increased piece prices, would probably earn less per day. The purchaser of these Plant patents would not be able to make effective use of them, since he could not combine with them the United Company's patents, and since machines made under them would infringe the United Company's patents; indeed, it is doubtful if such purchaser of the Plant patents could make commercially successful machines at all.

For a full discussion of the evidence regarding the purchase of Plant's patents and inventions, see our Main Brief, pages 507–586.

VII.

COVENANTS TAKEN FROM VENDORS, INVENTORS, AND EMPLOYEES IN CONNECTION WITH THE ACQUISITIONS.

The petition alleges that the defendants, in pursuance of their unlawful plan, have taken from vendors and inventors covenants not to engage in business for long terms of years in competition with the United Company, or to assign future inventions relating to boots and shoes (R. Vol. 1, p. 1000).

The District Court found these covenants were of the kind usually taken in such cases; that none of them clearly exceeded what the law permits, and that they failed to indicate any unlawful purpose (R. Vol. 1, p. 1141).

This finding of the District Court is fully supported by the record.

When covenants were taken they were of the usual character taken from the vendor of a business or from an inventor entering into a contract of employment or selling patent rights. Such agreements have been long recognized as essential to the protection of the vendee or employer. Indeed, covenants not to compete, if not expressed, are implied by law in Massachusetts where practically all of these transactions took place (see Main Brief, p. 496). In the present case the covenants were in no instance shown to exceed what is usual, lawful, and necessary. They utterly

fail to establish any intent to obligate either vendors or patentees unlawfully. The record shows that the officers of the company had no plan or design whatever with respect to these covenants, and that their form was left to the attorney who drew the papers and who inserted the form used in such cases.

In thirteen transactions there were no covenants as to competition or future inventions whatsoever. In most of the transactions where covenants were inserted it is evident that especial pains were taken to limit the covenant strictly to the particular kind of machines or goods which were sold.

The petition seriously misstates the extent and scope of many of the covenants, although the documents themselves were in the possession of the United States for a long time prior to the filing of the petition (see Main Brief, pp. 500–506).

For a discussion of the covenants and of the law bearing on them, see Main Brief, pages 491–506.

VIII.

THE UNITED COMPANY HAS NOT MADE EXORBITANT PROFITS.

The petition charges that the United Company has made enormous and unreasonable profits (R. Vol. 1, p. 1026).

Presumably this allegation was made to support the charge that the defendants planned by their unlawful project to "enhance the cost of said machines to users thereof" (R. Vol. 1, p. 997).

As the record shows that the United Company reduced the cost of its machines materially, this charge of a plan to enhance the cost is utterly unfounded. If, in spite of the increased cost of building machines, the United Company by its economies has reduced their cost to shoe manufacturers and at the same time has made large profits, this would hardly show an unlawful purpose.

But the charge that the United Company has made exorbitant profits is without foundation and the District Court so found (see Main Brief, p. 599).

The earnings from March 1, 1905, to March 1, 1911, based on net assets, are shown to have been 14.01 per cent. and the average rate of dividends to net assets, 7.10 per cent. (Main Brief, p. 598). These are surely not exorbitant earnings for a corporation which produces the best shoe machines made, which is the owner of many remarkable

patents and which has had such extraordinary success in developing new machines.

In the foregoing estimate of earnings based on net assets the United Company's patents were valued at only $400,000. The pulling-over machine alone cost $1,000,000 to develop, to say nothing of the patents on the many other new machines which the United Company has produced. If in making the foregoing estimate a fair value had been placed on the patents, the net earnings and dividends based on assets would have been very substantially reduced (see Main Brief, p. 599).

IX.

ALLEGED UNFAIR OR MONOPOLISTIC ACTS.

In Section VI, R. Vol. 1, p. 999, the United Company is charged with having made various threats or committed various unfair or oppressive acts. No specific instances are set out in the petition, but a bill of particulars setting forth the specific instances relied upon was filed during the course of the trial (R. Vol. 1, p. 1075).

The United Company during the course of its existence has had dealings with thousands of persons. It has over a thousand lessees with whom it is constantly in touch and with whom it has very intimate relations; it has had an average of over 80 new lessees a year; it has dealt with all the persons from whom it made the acquisitions considered above, and it has declined to purchase over 75 concerns and hundreds of inventions.

During this period and in its dealings with all these thousands of persons it has, of course, not been able to satisfy all of them. The United States produced at the trial practically every person who felt he had any grievance of any kind whatsoever against the United Company. These included inventors who had tried unsuccessfully to get the United Company to adopt and purchase their inventions, persons who had tried unsuccessfully to sell their businesses to the United Company, persons who had sold patents or machines to the United Company and felt for one reason or another that they had not received all they were entitled

to, lessees who had not treated the United Company fairly and had been requested to conform to certain of the provisions of their leases or against whom in a very few instances the United Company had enforced the leases, competitors who resented the success of the United Company and a group of large manufacturers who have sought to eliminate the competition of the small shoe manufacturers by getting for themselves more favorable terms from the United Company than it grants small shoe manufacturers.

The alleged statements of the employees of the United Company to which objection is made include statements made not merely by the principal executive officers but by minor officials or employees.

No one of these transactions considered by itself is of significance in the present case, in which the charge is one of a plan to acquire all shoe machinery concerns and to refuse to lease essential machines unless others are taken and the acquisition thereby of a monopoly of shoe machinery. It can hardly be contended that any one of these various alleged unfair acts is material in proving this charge. Their only importance is whether they show a consistent course of arbitrary action toward competitors and lessees and thus show a general unlawful intent and course of conduct on the part of the United Company.

An examination of the evidence relating to these transactions not only shows that they prove no such contention, but shows that the United Company, as the District Court found, has been "above reproach in any of these respects."

The District Court said (R. Vol. 1, pp. 1152–1153),

> "In view of the long period and wide fields thus searched, the numerous abandoned attempts to prove something of the kind above indicated, and the insignifi-

cant result of the evidence actually offered and finally relied on, the conclusion seems fully justified that the policy and methods pursued by the defendants and by the United Company have been, in general, above reproach in any of these respects."

It is significant that in respect to at least 30 of the more than 50 different alleged acts or threats specified by the United States in its Bill of Particulars it did not attempt to introduce any evidence whatsoever.

In the cases in which threats on the part of the employees of the United Company against competitors were charged it is significant that in no case is it contended that any attempt was made to carry out such threats. In every case in which any employee of the United Company was charged with making a threatening statement, such employee, if alive and available as a witness, denied having done so.

It was evident that these charges of unfair acts were made recklessly and without proper investigation of the facts by the United States.

X.

THE UNITED COMPANY HAS NO UNLAWFUL MONOPOLY OF SHOE MACHINERY.

It is essential to the case of the United States that it prove the existence of the unlawful monopoly of shoe machinery which it charges.

The United States, as we have shown, offered no direct proof of the unlawful project charged in the petition. For such proof it relies on the various acts of the defendants. If these acts have not resulted in an unlawful monopoly from 1899 to the present time, it is obvious that they were not adapted to accomplish a monopoly and, therefore, are not evidence of the existence of any such unlawful plan to monopolize.

Again, the purpose of this suit is (*a*) to have the United Company dissolved because it is an unlawful monopoly, and (*b*) to have the leases declared unlawful because they have created or assisted in the creation of this unlawful monopoly. If the United Company has no unlawful monopoly, it should not be dissolved. If the leases have not created an unlawful monopoly during the period from 1899 to date, they should not be held illegal on the ground that they have done so.

1. THE UNITED COMPANY HAS NO MONOPOLY OF ALL SHOE MACHINERY AS CHARGED IN THE PETITION.

The petition charges that the defendants in or prior to 1899 "determined to acquire a complete monopoly of the manufacture, sale, and lease of shoe machinery" (R. Vol. 1, p. 994), and it finally charges that by the various transactions specified the United Company has acquired such a monopoly.

That the United Company has no monopoly of all shoe machinery as charged by the petition appeared conclusively and was admitted by the United States (Main Brief, pp. 13–14, 606–608).

There is a large field of shoe machinery, including all machines for sewing the uppers of shoes, which the United Company does not manufacture at all. The following examples illustrate what proportion of the total number of shoe machines used by the ordinary shoe manufacturer are manufactured by the United Company.

Jonathan Brown & Sons, large McKay shoe manufacturers, who use all of the United Company's machines they can obtain, have 424 machines in their factory, of which only 128, or 30 per cent., were obtained from the United Company. Excluding General Department machines, which can be bought outright from the United Company at the option of the shoe manufacturer, and which are not included in the machines as to which monopoly is charged, only 15 per cent. of the machines in Brown & Sons' factory

were obtained from the United Company (see Main Brief, p. 603).

R. P. Hazzard, a large shoe manufacturer, who uses and prefers the United Company's machines, has 746 machines in his factory, of which less than 44 per cent. were obtained from the United Company, or, excluding General Department machines, less than 40 per cent. (see Main Brief, p. 603).

Thus the United Company furnishes considerably less than half of the total number of machines used (see Main Brief, pp. 603–604).

2. LIMITATION OF CHARGE OF MONOPOLY BY THE UNITED STATES.

Such being the facts as shown by the evidence, the United States, at the close of the trial of this case, attempted to limit its charge of monopoly to a monopoly of "machines for preparing and attaching the bottoms to the uppers of boots and shoes, the eyeletting machines, and the clicking machines" (R. Vol. 1, p. 839, lines 13–22; see also Main Brief, pp. 13–14).

While a considerable number of General Department machines, of which the United Company makes over 170 different kinds, are used in preparing the bottoms of shoes, it appeared that there were large numbers of machinery manufacturers making these classes of machines and no evidence was introduced to show what proportion, if any, the United Company furnished of these classes. At the first hearing of the case in this Court Mr. Smyth, of counsel for the United States, eliminated these machines from the

charge of monopoly, saying, according to the stenographic report of his argument:—

> "Something has been said about the General Department machines. We make no question with respect to them, and they are not involved in this law suit."

The foregoing concessions limit the charge of monopoly to a comparatively few machines. In Jonathan Brown's McKay shoe factory, for example, the machines of this class constitute only 15 per cent. of the total number of machines he uses and in Hazzard's welt shoe factory they constitute less than 40 per cent. (see Main Brief, p. 603). There are thus excluded from the charge of monopoly all machines for sewing uppers, buttonhole machines, lacing machines, all General Department machines, treeing machines, and various other miscellaneous machines.

The machines included in the charge are:—

Machines of the kind which were manufactured by the constituent companies in 1899:	Welting Machines. Lasting Machines. Heeling Machines. Metallic Machines. Pegging Machines.
Machines first put out by the United Company after 1899:	Eyeletting Machines. Pulling-over Machines. Clicking Machines. McKay Sewing Machines.

3. THE UNITED COMPANY HAS NO ACTUAL MONOPOLY OF MACHINES OF THE CLASSES TO WHICH THE CHARGE OF MONOPOLY IS NOW LIMITED.

The United Company has competitors who furnish machines of all the types as to which monopoly is charged. Some of them furnish complete lines of machines and do a considerable business.

Defendant's Exhibit 337 (R. Vol. 5, p. 906), compiled from catalogues, letters, and advertisements of various shoe manufacturers, gives a list of manufacturers and dealers who furnish machines of every type for preparing and attaching the bottoms to the uppers of shoes, eyeletting machines, and clicking machines, as to which monopoly is charged. Each machine is listed separately and the names of the concerns offering them are given. A total of 74 different concerns furnishing these machines is named.

Defendant's Exhibit 331 (R. Vol. 5, p. 838) gives a list of concerns putting out welt and turn machines and outsole stitching machines from 1899 to 1911.

Defendant's Exhibit 332 (R. Vol. 5, p. 843) gives a list of Goodyear auxiliary machines and machines for the same operations which other machinery manufacturers have offered for doing the same work.

Appendix III to our Main Brief summarizes the testimony of 50 witnesses—practically all shoe machinery manufacturers—representing 48 different concerns which, as their testimony shows, furnish machines of one kind or another which compete with the United Company's machines. A number of these machines are General Depart-

ment machines, which have been eliminated from the case by counsel for the United States, but a considerable number are machines of the classes as to which monopoly is still charged.

These lists show a large number of concerns which offer competing machines. Some, as stated, offer to furnish complete lines of machines.

Hamel, a witness for the United States, who succeeded to the business of the Duplessis Company, testified,—

> "We have a complete set of machines for making turn shoes and a complete set of machines for making welt shoes" (R. Vol. 1, p. 327, lines 15–16).

He and his predecessor have done a considerable business in bottoming machines even compared with the business of the United Company (see Main Brief, pp. 610–611).

The manager of R. H. Long Machinery Company testified that his company is ready to supply a full line of machinery for welt or turn shoes (R. Vol. 1, p. 345, lines 43–44).

The representative of the Haverhill Shoe Machinery Company, a witness for the United States, which has done a considerable business (Main Brief, p. 612), testified:—

> "We undertake to fill the requirements of a manufacturer whatever they are. We advertise that we furnish any manufacturer a full line of all kinds of shoe machinery, whether it is for welts or McKays, or turns or pegs or anything else. We are prepared to make good if our people that manufacture machines don't go back on us" (R. Vol. 1, p. 301, lines 3–9).

In addition, several large foreign concerns furnish complete lines of machines and, of course, these machines can

be obtained in this country if desired by shoe manufacturers (see Main Brief, p. 612).

The contention of the United States that a shoe manufacturer must come to the United Company for some of his essential machines because he cannot obtain them elsewhere is without foundation. Twenty of the concerns with which the Haverhill Company did business had no machines from the United Company (Main Brief, p. 613).

The United Company had only 1,033 lessees in 1911. Mr. Donham, secretary of the United Company, testified that he should say there were between 1,300 and 1,500 shoe manufacturers in the United States at that time. The census for 1910 showed in the neighborhood of 1,300. The petition alleges that there were about 1,300 in 1911 (see Main Brief, p. 614).

It is true that shoe manufacturers cannot obtain from competitors machines of exactly the same kind as the United Company makes, since its machines are patented. Nor can they obtain as good machines elsewhere. That they can obtain machines elsewhere for performing the operations performed by the United Company's machines and that a considerable business is done by others in bottoming machines is proved by the record (see Main Brief, pp. 608-614).

The District Court found (R. Vol. 1, p. 1135):—

> "In that part of the field of trade in shoe machinery to which the case is now limited as above, the defendants have been not monopolists but competitors. Their only means for holding the field have been legitimate means—better machines. *Their specialization in machines for bottoming shoes, and not a monopoly of such machines, has been the cause of their success*" (italics ours)

4. CONTENTIONS OF THE UNITED STATES IN RESPECT TO THE ALLEGED MONOPOLY.

The United Company, as we have shown above, has no actual monopoly of the machines in question. It does, however, do a very large and successful business in these classes of machines, furnishing most of the machines of these kinds in use. Of course this is no proof of any unlawful monopoly, unless it is shown that this undoubted success of the United Company is due to arbitrary and unlawful methods.

The United States, as we understand their argument, contends, that this success is due primarily:—

(1) To the acquisition of competitors.

(2) To the Restricted Use Clauses in the leases, which, it contends, compel a shoe manufacturer taking one kind of machine to take other kinds.

(3) To the fact that the shoe manufacturers hold the United Company's machines under lease and competitors are thus deprived of a market for their machines.

We shall briefly consider these contentions.

5. THE UNITED COMPANY HAS NOT OBTAINED ITS SUCCESS BY ELIMINATING COMPETITORS.

As we have shown, at the time the United Company was formed its constituent companies were putting out practically all the welting, lasting, heeling, and metallic machines which were being manufactured in the country (*supra*, pp.

26, 37). The Consolidated Company, through its subsidiary company, the Davey Company, was also putting out practically all the pegging machines in use.

The United Company, therefore, did not enter a field in which there was competition and eliminate the competition in these machines.

The United Company has not acquired competing concerns making the classes of machines which were furnished by the constituent companies. Including the Plant purchase, only 11 of the acquisitions related to patents or machines of this character. Only 6 of these concerns were doing any shoe machinery business at all. In all of these transactions something new was acquired which the United Company did not have. Apart from the valuable patents acquired from Plant, the transactions were of slight consequence. The aggregate considerations paid for such of these concerns as were actually doing shoe machinery business was less than $150,000, and no real estate was acquired from any of these concerns (see Main Brief, p. 472).

On the other hand, the record shows that while in 1899 there was practically no competition in machines of these classes, there are now a number of competitors doing a considerable business in such machines. Most of these competitors have been offered for sale to the United Company and their purchase declined (*supra*, pp. 165–166). So far, then, from entering a field in which there was competition and eliminating such competition by the acquisition of competitors, the record shows the reverse.

In respect to the machines developed by the United Company after its formation as to which monopoly is also charged, the record likewise shows conclusively that the

success of the United Company has not been due to the acquisition of competitors.

Eyeletting machines were developed by the United Company and first put out in 1902 (see Main Brief, p. 623). No competitor making eyeletting machines has ever been acquired. The clicking machine was developed and first put out in 1908 (see Main Brief, p. 622). No competitor making clicking machines has ever been acquired. Pulling-over machines were first put out by the United Company in 1902 and the Auxiliary pulling-over machines about 1905 (see Main Brief, p. 622). No competitor making pulling-over machines has ever been acquired or eliminated. The only purchase relating to pulling-over machines was the purchase of the experimental pulling-over machine of the Seaver Process Lasting Company in 1900, a machine which was not capable of successful operation nor ever put upon the market. This was acquired in order to obtain patents to assist the United Company in developing its own machine (Main Brief, Appendix I, pp. 673–674). At the time of this purchase the United Company was experimenting, but it did not succeed in developing a pulling-over machine until two years later. At the time of this purchase, therefore, no business of manufacturing pulling-over machines had even been created and no competition was, therefore, eliminated.

The United Company did acquire in 1908 the Richardson Company's business and patents relating to a McKay sewing machine in order to improve its McKay machine, and later, as an incident to the Plant purchase, acquired the Stanley Company's business in McKay machines. But this gave it no monopoly or control of McKay machines. Any machine-shop can manufacture them and they can be obtained of a

large number of shoe manufacturers and dealers (see Main Brief, p. 609). The United Company only acquired patents enabling it to make an improved machine.

It is clear that such success as the United Company has had in furnishing the foregoing machines which comprise all the machines as to which monopoly is charged has not been due to the acquisition of competitors.

6. THE UNITED COMPANY'S SUCCESS IS NOT DUE TO ANY COMPULSION RESULTING FROM THE RESTRICTED USE CLAUSES IN ITS LEASES.

The United States contends that the Restricted Use Clauses compel a shoe manufacturer desiring machines of one kind or department to take machines of other kinds or departments which he would otherwise take from the United Company's competitors and that this compulsion accounts in part for the United Company's success.

We have shown above that a shoe manufacturer can obtain machines of any kind he pleases from competitors, though, of course, they are not of the type of the United Company's patented machines and are inferior. But no one is compelled to take machines from the United Company for the reason that he cannot obtain machines for performing the same operation elsewhere.

We have also shown in discussing the leases that unrestricted leases of the machines of every department are offered lessees on reasonable terms, or, in the case of General Department machines, that they are sold outright without restrictions.

The consequence is that if a shoe manufacturer desires to take machines of any department from the United Company he can do so and can obtain all other machines from competitors. The Restricted Use Clauses, therefore, cannot compel a monopoly of the United Company's machines. That they do not compel such monopoly, or account for the United Company's success in furnishing machines of the kind as to which monopoly is charged by compelling a shoe manufacturer desiring other types of machines to take these types also, is conclusively shown by the following illustrations.

No machines which the United Company puts out are restricted to use with its eyeletting machines under any form of lease (*supra*, p. 133). The alleged monopoly of these machines, therefore, cannot be due to the fact that lessees desiring to use other types of machines are compelled by the Restricted Use Clauses to take eyeletting machines also.

No machines which the United Company puts out are restricted to use with clicking machines. Thus the Restricted Use Clauses cannot compel their use.

No machines which the United Company puts out are restricted to use with its 43 Goodyear auxiliary machines. The Restricted Use Clauses, therefore, cannot compel their use.

No machines which the United Company puts out are restricted to use with its pulling-over machines, except the No. 5 Lasting Machine, a new machine developed by the United Company in 1908 (Main Brief, pp. 295, 357). As the hand method welt and hand method McKay lasting machines can do the work done by the No. 5 machine, this single exception in an alternative form of lease can

have little effect in compelling a use of pulling-over machines.

No machine the United Company puts out is restricted to use with the McKay sewing machine (Main Brief, p. 354). The Restricted Use Clause, therefore, cannot compel a use of McKay machines.

No machines are restricted to use with any of the 172 General Department machines. If monopoly is claimed as to any of these machines it cannot be the result of compulsion exerted by the Restricted Use Clauses (Main Brief, pp. 357–358).

On March 1, 1911, there were 56,873 machines of the above kinds outstanding out of a total of 90,276 machines under lease (Defs.' Ex. 228, R. Vol. 5, p. 430).

If the Restricted Use Clauses do not account for the success of the United Company in furnishing eyeletting, pulling-over, clicking, Goodyear auxiliary, and McKay machines, and it surely cannot be contended that they do, it would require strong evidence to show that they account for its success in furnishing welting, lasting, heeling, metallic, and pegging machines, the other types as to which monopoly is charged.

7. CONTENTION THAT ~~THE FACT THAT~~ THE UNITED COMPANY BY ITS LEASES MONOPOLIZES POSSIBLE CUSTOMERS.

The United States contends that the fact that shoe manufacturers hold the United Company's machines under lease excludes competitors and accounts for its success in furnishing machines. In other words, the United States

charges that possible customers have been monopolized, and as a consequence the business of furnishing machines is monopolized.

Of course the fact that many or most shoe manufacturers already have the best machines made makes it difficult for competitors to supply them with machines, especially inferior machines. But this is no ground for charging unlawful monopoly. As the District Court said (R. Vol. 1, p. 1185),—

> "One who goes into a field of manufacture already occupied must expect to find factories so fully equipped that they are no longer customers."

We have shown that the only clause in the leases requiring a lessee to make any use whatsoever of the United Company's machines is the Full Capacity Clause, which requires a use only of the particular machine or machines leased. Shoe manufacturers are free to take any additional machines they may require from competitors. In addition all new manufacturers are free to take all their machines from competitors or such machines as they desire from the United Company on unrestricted leases when necessary, and the remainder from competitors.

746 new concerns started in business from March 1, 1900, to December 31, 1911, an average of 62 a year. In addition 270 new concerns succeeded old concerns, an average of 22 a year (Defs.' Ex. 223, R. Vol. 5, p. 390). The United Company had only 1,033 lessees in 1911 (see Main Brief, p. 614).

All of these new concerns, a total of 1,010, were entirely free to take competitors' machines. Furthermore, any existing firm can dissolve or its members or stockholders

can form a new corporation and start business free from any obligations to the United Company. This large field of new concerns is surely open to competitors whatever view is taken of the United Company's leases.

The truth is, as the District Court pointed out, that manufacturing facilities and natural resources may be monopolized, but it is not practicable to monopolize possible customers (R. Vol. 1, pp. 1181–1182).

If every shoe manufacturer in the country to-day were required to deal with the United Company exclusively, competitors having equally good or superior machines which they offered on as favorable or more favorable terms would not be deprived of a market. There would almost immediately be a large group of new shoe manufacturers in the market, including those who entered business for the first time in the natural course of events, and those who saw an opportunity to compete with existing manufacturers by getting machines on more favorable terms from competitors.

XI.

THE CAUSES OF THE UNITED COMPANY'S SUCCESS.

The reason that most of these new shoe manufacturers just entering business obtain their machines from the United Company is not due to the elimination of competitors. They can obtain their machines elsewhere. It is not due to the Restricted Clauses in the leases. They need take no machines from the United Company; they can take unrestricted leases of such of its machines as they desire and even if they do take from the United Company all of its machines they desire on restricted or non-initial payment leases, they can, as we have shown (*supra*, pp. 131–136), still take many, and in some instances all, of their other machines from competitors and use the United Company's machines with them. For instance, if they take the United Company's welter and stitcher on any lease whatsoever, they can obtain all their other machines from competitors and use the welter and stitcher with such machines. It is obvious that the reason such new shoe manufacturers, who are under no obligation to the United Company, choose its machines is because they prefer them.

The United Company's success is due to entirely lawful and natural causes which are shown in the record.

1. THE UNITED COMPANY'S LAWFUL PATENT MONOPOLIES.

In an unpatented industry, such as the tobacco business, any one having sufficient capital is free to enter and engage in the business on equal terms. It would be extraordinary if one concern acquired all or most of the business and such a result might well raise a presumption of unlawful methods. In a patented industry like the shoe machinery business, which is not yet fully developed and is still dominated by patents, one manufacturer is almost certain to have superior patents and, therefore, to obtain a large part, if not all, of the business. Until the industry has passed the stage of great improvements and the important patents have expired, such a result is normal and to be expected. The shoe machinery industry is still in this condition of development. In view of the very recent invention of most shoe machines by the United Company and its constituent companies and the remarkable improvements and inventions made by the United Company, it is only strange that so many other concerns are engaged in the business at all.

Take the telephone as an example. The Bell Company, as is well known, absolutely dominated the telephone field for many years through the acquisition of the Bell patent and the subsequent patents of Berliner, Blake, and Edison (see *United States* v. *Bell Telephone Company*, quoted *supra*, p. 179). There were no competitors at all in the field. Yet this success was entirely lawful and due to its lawful patent monopolies. It was the success which the Government insures to successful inventors.

This Court in *United States* v. *Winslow*, supra, said of the United Company's machines (p. 217),—

> "The machines are patented, making them is a monopoly in any case, the exclusion of competitors from the use of them is of the very essence of the right conferred by the patents, *Paper Bag Patent Case*, 210 U. S. 405, 429, **and it may be assumed that the success of the several groups was due to their patents having been the best"** (black letters ours).

The United Company's machines have been used by shoe manufacturers for the same reason the Bell Company's telephone was used. No other telephone was as serviceable and the public "insists upon having the best and most serviceable." After the expiration of the Bell patent this remained true because of the acquisition of the later improvements of Berliner, Blake, and Edison (see *United States* v. *American Bell Telephone Co.*, supra). There is no more justification for charging unlawful monopoly in the present case than there would have been in the case of the telephone.

The Goodyear Company, through its patents, created welt machines and the business of manufacturing and furnishing them. No machines for making welt shoes had ever before been invented. It naturally obtained all the business of these machines when first put out and since its machines, due to subsequent improvements, have remained pre-eminently the best, it and its successor the United Company naturally retained this business. The same is true of the lasting, metallic, and heeling machine business. All of these machines are recent creations. Lasting machines were just coming into use in the early 90's and were only

partially developed in 1899 (see Main Brief, pp. 84–87). All of these machines have been constantly improved and have remained unquestionably the best machines of their kind in the market.

The eyeletting machines were first developed by the United Company in 1902. Pulling-over machines, which cost $1,000,000 to develop, were invented by the United Company and first put out in 1903; and the pulling-over auxiliaries since then. Is it extraordinary that no one else in the short period since 1903 has been willing to spend such an amount of money in attempting to develop an equally efficient machine and that no one else has succeeded in so doing? The clicking machine was invented by the United Company and first put out in 1908. In other words, this machine, of which a monopoly is charged, was unknown to the world three years prior to the filing of the present suit (see Main Brief, pp. 622–623). Is it extraordinary that the United Company, which created the machine, has furnished most of the machines in use, and that no machine as good or superior has in this short period of time been invented by any one else?

These machines which the United Company and its constituent companies created under their patents are the machines as to which a monopoly is charged. They are, as the District Court found, superior to any other machines on the market. It would take strong evidence, wholly lacking in this case, to show that the success of the United Company has not been due to the lawful patent monopolies under which the machines were created and under which they have been perfected and improved.

2. OTHER CAUSES OF THE UNITED COMPANY'S SUCCESS.

In addition to its lawful patent monopolies which make its machines far better and more efficient than any machines manufactured by competitors and which alone account for the United Company's success, the following factors have also contributed to this success:—

A. The United Company furnishes a remarkable service with its machines of vital importance to shoe manufacturers. No such service is furnished by any other manufacturer of bottoming machines.

B. The United Company has assured the shoe manufacturer of the most modern and most efficient machines by replacing outstanding machines with new and improved machines when invented, without cost to the shoe manufacturer.

C. The United Company furnishes machines constructed and adapted for effective use together.

D. The United Company offers its machines on remarkably favorable terms under a leasing system which requires the shoe manufacturer to make practically no capital expenditure; it has created business in this way by enabling many small shoe manufacturers to enter business; and it has consistently reduced its charges, although the machines have been greatly improved and the cost of their manufacture is increased. As Mr. Jones, a witness for the United States and an opponent of the United Company, stated publicly and affirmed in his testimony in this case (R. Vol. 1, p. 136, lines 2–13),—

"The terms which the Machinery Company have recently offered their patrons on certain lines of machinery are so liberal that the outsiders cannot compete."

3. FINDING OF THE DISTRICT COURT AS TO THE CAUSES OF THE UNITED COMPANY'S SUCCESS.

The District Court found that the United Company's success was due to the various factors outlined above. It held:—

> "That the degree of success attained and the preponderance in number of users supplied which the United Company has secured are fully accounted for by the superior efficiency it has developed in its patented machines for work in combination with each other, together with the superior facilities it affords as above for their most efficient use, must be regarded as shown beyond question" (R. Vol 1, p. 1137).

For its further findings in this respect see Main Brief pp. 67–70.

XII.

THE RELIEF PRAYED FOR.

The United States asks that the United Company be dissolved; that the leases be declared unlawful and that the United Company be enjoined from enforcing them.

The utter impossibility of granting this relief without disastrous consequence to shoe manufacturers and the public shows conclusively that the United Company is not an unlawful combination and that the clauses in its leases are reasonable provisions necessary to enable it to offer its machines on the present favorable terms. This subject deserves the most careful study, and we respectfully call the Court's attention to the discussion in our Main Brief, pp. 630–646. We shall summarize the discussion here.

1. A DISSOLUTION OF THE UNITED COMPANY'S BUSINESS WOULD DISASTROUSLY AFFECT SHOE MANUFACTURERS AND THE PUBLIC.

The United Company's business consists of manufacturing a great variety of different kinds of machines under patents. The manufacture of each machine is dependent on the ownership of the patents protecting it; in other words, the right to manufacture the machine follows the ownership of the patents. So long, for example, as the United

Company retains its patents on the welter, no one else can manufacture it. If it transfers these patents, it can no longer manufacture the machine and would be in no better position to do so than any other member of the public.

The United Company has a single manufacturing plant at Beverly at which its machines are manufactured. The four or five other plants it owns through subsidiary companies are small and manufacture only supplies and a few miscellaneous machines of no special importance (Main Brief, pp. 631–632).

A division of the United Company's business could be attempted in only one of three ways:—

(1) By attempting to divide it into competing concerns;

(2) By attempting to compel the company to dispose of the acquisitions it has made;

(3) By dividing it into non-competing concerns similar to the original constituent companies.

1. *Attempt to Divide the United Company into Competing Concerns.* The United Company has for practical purposes a single improved machine of each type. Where it has two models of the same machine, or in the very few instances where it has two different types of machine which can perform the same operation, in practically every instance both models or types embody certain patents in common so that if the patents on one machine were transferred the other could not be manufactured.

No other concern can acquire a right to make any of the machines unless it acquires the United Company's patent rights which are embodied in the machine. The only way in which it would be possible to attempt to create competition would be to divide the patents on each machine between the United Company and some other concern.

For example, the present outsole stitcher was created by a combination of the inventions of 22 different patents, each of which contributes some factor of efficiency. It would be possible to order the United Company to dispose of 11 of these patents.

But if this were done, what would be the result? (*a*) Neither the United Company nor its assignee could make the present efficient machine. The art of making this machine would be put back a generation and the remarkable fruits of the development work which have resulted in the present machine would be lost; (*b*) if both concerns could construct machines under the patents held by them, one or the other concern would indubitably have superior patents (patents, of course, do not all have the same value), and as a consequence one machine would be superior to the other and competition on equal terms would not be created; (*c*) as neither concern would have patents enabling it to construct the present machine, but would only have certain patents applicable to a machine of this kind, each concern would have to develop and reorganize a new machine out of the patents it held. It might be a matter of years before this could be done so as to produce commercial machines. For examples of the difficulties involved, see our discussion of the difficulties confronting Plant in the reorganization of his machines (see Main Brief, pp. 531–534). In the mean time, there would be no machines to offer shoe manufacturers who now look to the United Company for their supply.

These difficulties would arise in respect to all of the machines.

Again, only one of the concerns would have a plant to manufacture machines, since the Beverly plant cannot be

divided into parts. Only one concern would have the patterns, etc., for the manufacture of the machines. The other concern would have to obtain a plant, obtain tools and special patterns, and, before it could manufacture, it would be obliged to reconstruct the present machines so as to avoid infringement of the patents held by the other concern.

The above brief discussion shows the utter confusion and the disastrous consequences which would result from an attempt to create competition in machines of the type manufactured by the United Company by a division of the patents. It shows conclusively that the combination of these patents in one concern not only does not prejudice the public, but is of vital importance to the public and is the cause of the remarkable advance made in recent years in the shoe machinery industry.

In every other case in which dissolution has been ordered there was a combination of different plants or businesses which, when separated, could continue to serve the public with the same goods or product previously furnished. The only difference has been that competition was created.

2. *Attempt to Set Apart the Acquisitions.* As the United Company by its acquisitions of inventions relating to shoe machines, or of shoe machines, has in practically every instance acquired something new, an attempt to set apart the machines, inventions, and the business of furnishing supplies so acquired would not create competition.

Furthermore, in most instances it would result in stripping some machine of the United Company of an improvement, thus decreasing the efficiency of the machine without giving the assignee any patent which would enable him to place an efficient or even commercial machine on the market.

The Plant acquisition, as we have shown, was the only one of any importance. If the United Company sold the Plant patents, it would be obliged to strip 26 of its important machines of valuable improvements; a number of its other machines would have to be rebuilt and reorganized in order to avoid infringement of the Plant patents so sold; the vast improvements made in the new models of welter and stitcher would be lost; the vendee would get a variety of patents which by themselves and without combination with the United Company's patents would not be capable of really effective and efficient use, he would have no manufacturing plant, and it would be doubtful, to say the least, if he would ever produce or be able to produce commercially satisfactory machines which would compete with the United Company (see discussion of Plant acquisition, Main Brief, pp. 507–586).

3. *Division into Non-competing Groups.* A division of the machines of different departments among different non-competing concerns would, of course, be possible. Thus the Goodyear machines could be put in one company, and the lasting, heeling, metallic, and new machines in four other non-competing companies. But no useful result would be accomplished. No competition would be created, and the companies could again combine unless enjoined, as such combination would be lawful (*United States* v. *Winslow*, supra). On the other hand, the result of such a division of the business would be that the advantages of service rendered economically by one concern, of savings in manufacturing expenses, standardization of parts, and an adaptation of the different types of machines so as to harmonize with each other, would be lost.

2. TO HOLD THE LEASES VOID WOULD DISASTROUSLY AFFECT SHOE MANUFACTURERS AND THE PUBLIC.

The leased machines belong to the United Company. If the leases are held void, no lessee would be entitled to use the United Company's machines which he now holds until he made a new agreement with it.

If the United Company cannot employ the present clauses which, as we have shown, are essential to the existing leasing system, it must necessarily in any new agreements made with its lessees adopt an entirely new system.

We believe the record demonstrates conclusively, that if the present clauses cannot be used the United Company cannot grant shoe manufacturers the present favorable terms. If the United Company cannot use the Full Capacity Clause, it certainly cannot install valuable machines in a shoe factory and depend for its return on a royalty based on the use of the machines. If it cannot lease its machines for a long term of years, it certainly cannot construct machines to be placed in a factory without initial payment and run the risk of their being returned before a fair royalty has been paid. If it cannot reserve the right to take back its machines when the lessee provides himself with other machines of the same kind to do his work, it cannot place its machines in the lessee's factory on the present basis without initial payments. If it cannot take back all its machines when the lessee violates agreements in respect to certain of them and threatens to violate his agreements as to the remainder, it cannot afford to place them in the lessee's factory without a substantial guarantee

in the form of a cash initial payment. If it cannot lease auxiliary machines for use with principal machines as a unit, it cannot afford to lease and care for these machines at all on a royalty basis. If it cannot employ the Restricted Use Clauses or clauses having the same effect, it cannot offer a reduced price for the use of a series of machines although such use brings it in a greater return and the cost of caring for the machines is less; and it must, therefore, charge a higher price for each machine leased based on its use independently.

As a result then, the United Company, if the leases are held unlawful, must either sell its machines outright or in any event charge large initial payments, a fixed rental instead of the present royalty based on use, and it must charge for each machine a price based on its use independently. This being so, the principal advantages of the present leasing system (*supra*, pp. 81–84), which has proved so highly beneficial to shoe manufacturers and on the basis of which the shoe machinery industry was created and is founded, would be lost.

In other words, as we have shown (*supra*, pp. 79–80), the attack of the United States, while in form an attack upon certain provisions in the leases, is in reality an attack upon the leasing system itself, since these clauses are essential to its maintenance. If the use of these clauses is forbidden, it means the destruction of the system of leasing without initial payments for a royalty based on the amount of use and with a reduction where machines are used as a series and thus produce a greater return.

This would be particularly hard on the small shoe manufacturers, who are especially assisted by the present system which enables them to get machines without capital ex-

penditure and enables them to pay royalty on the basis of production and not on the basis of the capacity of the machine, which is many times greater than their usual requirements. It would indubitably prevent many men of small means from entering the industry in the future and would thus assist the large manufacturers in concentrating the shoe business into their own hands.

The immediate consequence of declaring the leases illegal would be that shoe manufacturers would lose their present leases, and to obtain new leases would necessarily be required to pay the United Company at least substantial sums in the way of initial payments and would necessarily obtain less favorable terms in other ways. In case it should be decided necessary to sell machines outright instead of leasing them, shoe manufacturers would be required to purchase all their machines outright, and pay the full value of the machines. Either result would be especially hard on small shoe manufacturers, all of whom would find it difficult, and many of whom would find it impossible, to make the payments (see Main Brief, pp. 636–639).

3. CONTENTION OF THE UNITED STATES THAT THE UNITED COMPANY CAN BE RESTRAINED FROM ENFORCING THE LEASES WITHOUT DECLARING THE LEASES VOID.

Counsel for the United States seek to avoid the foregoing consequences which would result if its prayer were granted, by contending that the United Company may be enjoined from enforcing the illegal clauses in the leases without de-

claring the leases void. In this way they suggest that shoe manufacturers may retain their present machines without additional payment and be freed from the provisions which protect the United Company as owner of the machines.

Such a proposal would, of course, not compel the United Company to give shoe manufacturers additional machines or improved machines on the same terms, so that its effect would be comparatively short-lived, nor would it compel the United Company to grant these terms to new manufacturers entering business hereafter, who would thus be placed at a distinct disadvantage.

But further, as applied to present leases, the proposal is without justification.

For example, take the seventeen-year term. If the United Company were enjoined from enforcing this term, it would be because it is illegal. If so, there would be no term in the leases and either party could cancel them. If the lessee had a right to return the machines because the seventeen-year term is illegal he could not refuse to return them on the ground that it is legal and, therefore, binds the United Company.

Take the Full Capacity Clause. The machines were placed in the lessee's hands on the understanding that they would be used to capacity if the lessee had work for them to perform. This agreement goes to the very root of the contract; if not complied with, the United Company might get no return whatever on its machines. If not complied with by the lessee, an important part of the consideration for the lease agreement is removed, and the entire agreement between the parties falls. To hold otherwise would be to hold that the Court can create a new contract between

the parties not agreed to by either and in some instances at least deprive the United Company of its entire return in its machines, and thus, as a practical matter, confiscate them.

The same is true of the Restricted Use and other clauses (see Main Brief, pp. 639–642).

In the case of the Factory Output Clause, to enjoin enforcement of it and at the same time permit the lessee to retain the machines would deprive the United Company of any royalty whatever on its valuable Goodyear machines for which it gets its highest royalties, since this is the only clause in the leases of most of these machines requiring any payment of royalty whatsoever. These machines would by decree of this Court be confiscated without any payment at all.

We submit that there is no justification for the contention that these clauses, which go to the very root of the contracts between the United Company and its lessees, and in fact constitute the contracts, can be held illegal, without necessarily holding the contracts themselves (that is, the leases) illegal (see Main Brief, pp. 639–644).

4. THE LESSEES ARE NECESSARY PARTIES TO THE SUIT.

To hold the leases unlawful would deprive the lessee of the right to use the United Company's machines for the terms of the leases at the present favorable rates and force them to make new agreements with the United Company

on terms which, as we have shown, would necessarily be less advantageous.

The lessees are, therefore, vitally interested in the question whether the leases are to be held valid. They are necessary parties in a suit to declare the leases invalid. For authorities to this effect, see Main Brief, pp. 644–646.

XIII.

CONCLUSION.

The history of the United Company during the twelve years of its existence has been the history of the development of an efficient and intelligently and ably managed enterprise which by normal methods has vastly improved the art of shoe machinery and the manufacture of shoes.

The attempt of the United States to prove that the success of the United Company was due to unlawful means completely failed. The charges of the United States were made recklessly and without investigation. The petition is replete with allegations made without any foundation of fact whatsoever. Thus, for example, the allegation that the United Company discontinued the sale of machines; the allegation that the patents of the constituent companies were about to expire; the allegation that the leases required the lessee to covenant to use United Company's machines of the kind leased and all other kinds exclusively; the allegation that the United Company acquired various patents and held them without making any use of them, thus depriving the manufacturer and the public of the benefits arising therefrom; the allegation that exorbitant prices were charged for repair parts; the allegation that the constituent companies were taken over for values far in excess of real worth, and numerous other allegations, were shown to have no foundation whatsoever, although the true facts would have been disclosed upon the slightest investigation.

The District Court heard the witnesses in open court and thoroughly investigated the entire business history of the United Company. The facts on which its opinions are based are fully sustained by the record, and completely dispose of the contentions of the United States.

We respectfully submit that the decree of the District Court dismissing the bill should be affirmed.

Respectfully submitted,

FREDERICK P. FISH
CHARLES F. CHOATE, JR.
MALCOLM DONALD
Counsel for Appellees
